1. Preface

Introduction

Congratulations on the purchase of your new Universal Robots robot, that consists of the robot arm (manipulator), Control Box and the Teach Pendant.

Originally designed to mimic the range of motion of a human arm, the robot arm is composed of aluminium tubes, articulated by six joints, allowing for a high range of flexibility in your automation installation.

The Universal Robots patented programming interface, PolyScope, allows you to create, load and run your automation applications.

About this manual

This manual contains safety information, guidelines for safe use, and instructions to mount the robot arm, Control Box and Teach Pendant. You can also find instructions for how to begin to install and how to start programming the robot.

Read and adhere to the intended uses. Perform a risk assessment. Install and use in accordance with the electrical and mechanical specifications provided in this user manual.

Risk assessment requires an understanding of the hazards, risks and risk reduction measures for the robot application. Robot integration can require a basic level of mechanical and electrical training.

Content disclaimer

Universal Robots A/S continues to improve the reliability and performance of its products, and as such reserves the right to upgrade products, and product documentation, without prior warning. Universal Robots A/S takes every care to ensure the content of the User Manual/s is precise and correct, but takes no responsibility for any errors or missing information.

This manual does not contain warranty information.

Online manuals

Manuals, guides and handbooks can be read online. We have gathered a large number of documents at <https://www.universal-robots.com/manuals>

- PolyScope Software Handbook with descriptions and instructions for the software
 - The Service Handbook with instructions for troubleshooting, maintenance and repair
 - The Script Directory with scripting for in depth programming
-

UR+	The online showroom UR+www.universal-robots.com/plus provides cutting-edge products to customize your UR robot application. You can find everything you need in one place – from tools and accessories to software. UR+ products connect to and work with UR robots to ensure simple set-up and an overall smooth user experience. All UR+ products are tested by UR. You can also access the UR+ Partner Program via our software platform plus.universal-robots.com to design more user-friendly products for UR robots.
Academy	The UR Academy site academy.universal-robots.com offers a variety of training opportunities.
myUR	The myUR portal allows you to register all your robots, keep track of service cases and answer general support questions. Sign into myur.universal-robots.com to access the portal. In the myUR portal, your cases are handled either by your preferred distributor, or escalated to Universal Robots Customer Service teams. You can also subscribe to robot monitoring and manage additional user accounts in your company.
Developer suite	The UR Developer Suite universal-robots.com/products/ur-developer-suite is a collection of all the tools needed to build an entire solution, including developing URCaps, adapting end-effectors, and integrating hardware.
Support	The support site www.universal-robots.com/support contains other language versions of this manual
UR forums	The UR Forum forum.universal-robots.com allows robot enthusiasts of all skill levels to connect to UR and each other, to ask questions and to exchange information. While the UR Forum was created by UR+ and our admins are UR employees, the majority of the content is created by you, the UR Forum user.

2. Liability and Intended Use

2.1. Limitation of Liability

Description	Any information provided in this manual must not be construed as a warranty, by UR, that the industrial robot will not cause injury or damage, even if the industrial robot complies with all safety instructions and information for use.
--------------------	--

2.2. Intended Use

Description	 NOTICE Universal Robots takes no responsibility and assumes no liability for unapproved uses of its robots or uses for which its robots are not intended and Universal Robots will provide no support for unintended uses.  READ MANUAL Failure to use the robot in accordance with the intended use can result in hazardous situations. • Read and follow the recommendations for intended use and the specifications provided in the User Manual.
--------------------	--

Universal Robots robots are intended for industrial use, to handle tools/end effectors and fixtures, or to process or transfer components or products.

All UR robots are equipped with safety functions, which are purposely designed to enable collaborative applications, where the robot application operates together with a human. The safety function settings must be set to the appropriate values as determined by the robot application risk assessment.

The robot and Control Box are intended for inside use where, normally, only non-conductive pollution occurs i.e. Pollution degree 2 environments.

Collaborative applications are only intended for non-hazardous applications, where the complete application, including tool/end effector, work piece, obstacles and other machines, is low risk according to the risk assessment of the specific application.

**WARNING**

Using UR robots or UR products outside of the intended uses can result in injuries, death and/or property damage. Do not use the UR robot or products for any of the below unintended uses and applications:

- Medical use, i.e. uses relating to disease, injury or disability in humans including the following purposes:
 - Rehabilitation
 - Assessment
 - Compensation or alleviation
 - Diagnostic
 - Treatment
 - Surgical
 - Healthcare
 - Prosthetics and other aids for the physically impaired
 - Any use in proximity to patient/s
- Handling, lifting, or transporting people
- Any application requiring compliance with specific hygienic and/or sanitation standards, such as proximity or direct contact with food, beverage, pharmaceutical, and /or cosmetic products.
 - UR joint grease leaks, and can also be released as vapor into the air.
 - UR joint grease is not “food grade”.
 - UR robots do not meet any food, National Sanitization Foundation (NSF), Food and Drug Administration (FDA), or hygienic design standards.

Hygienic standards, for example ISO 14159 and EN 1672-2, require a hygiene risk assessment be conducted.

- Any use, or any application, deviating from the intended use, specifications, and certifications of UR robots or UR products.
- Misuse is prohibited as the result could be death, personal injury, and /or property damage

UNIVERSAL ROBOTS EXPRESSLY DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY OF FITNESS FOR ANY PARTICULAR USE.

**WARNING**

Failure to consider the added risks due to the reach, payloads, operating torques and speeds associated with robot application, can result in injury or death.

- Your application risk assessment shall include the risks associated with the application's reach, motion, payload and speed of the robot, end effector and workpiece.

3. Your Robot

3.1. Technical Specifications UR8 Long

Robot type	UR8 Long
Maximum payload	8 kg (17.6 lb) 10 kg (22 lb) with boundary conditions according to the manual.
Reach	1750 mm / 68.9 in
Degrees of freedom	6 rotating joints
Programming	PolyScope 5 GUI on 12" touchscreen or PolyScope X GUI on 12" touchscreen
Power consumption (average)	615 W Approx. 350 W using a typical program
Ambient temperature range	0-50 °C with reduced performance from 35 °C and up.
Safety functions	17 sophisticated safety functions. PLd Category 3 in accordance with: EN ISO 13849-1.
IP classification	Robot Arm: IP65, Control Box: IP44, Teach Pendant: IP54
Pollution degree	2
Humidity	90% non-condensing
Noise	Robot Arm: less than 65 dB(A), Control Box: less than 50 dB (A)
Tool I/O ports	2 digital in, 2 digital out, 2 analog in
Tool I/O power supply & voltage	2 A (Dual pin) 1 A (Single pin) & 12 V/24 V
Force Torque sensor accuracy	10 N
Speed	All wrist joints: Max 300 °/s Elbow joint: Max 240 °/s Base and Shoulder joints: Max 180 °/s
Pose repeatability	± 0.08 mm / ± 0.0031 in per ISO 9283
Joint ranges	± 360 ° for all joints
Footprint	Ø245 mm / 9.65 in
Materials	Aluminium, PC/ASA plastic, steel
Robot arm weight	44.7 kg / 98.5 lb
System update frequency	500 Hz
Control Box size (W × H × D)	460 mm x 449 mm x 254 mm / 18.2 in x 17.6 in x 10 in
Control Box weight	12 kg / 26.5 lb
Control Box I/O ports	16 digital in, 16 digital out, 2 analog in, 2 analog out
Control Box I/O power supply	24 V/2 A

Communication	MODBUS TCP & EthernetNet/IP adapter, PROFINET, USB 2.0, USB 3.0
Control Box power source	100-240 VAC, 47-440 Hz
Short-Circuit Current Rating (SCCR)	200A
TP size (W × H × D)	300 mm x 231 mm x 50 mm
TP weight	1.8 kg / 3.961 lb
TP cable: Teach Pendant to Control Box	4.5 m / 177 in
Robot Cable: robot arm to Control Box	High flex (PUR) 3 m/118 in x 12.1 mm High flex (PUR) 6 m/236 in x 12.1 mm High flex (PUR) 12 m/472.4 in x 12.1 mm

3.2. What Is In The Box

In the boxes

- Robot arm
- Control Box
- Teach Pendant or a 3PE Teach Pendant
- Mounting bracket for the Control Box
- Mounting bracket for the 3PE Teach Pendant
- Key for opening the Control Box
- Cable for connecting the robot arm and the Control Box (multiple options available depending on robot size)
- Mains cable or power cable compatible with your region
- Round sling or lifting sling (depending on robot size)
- Tool cable adapter (depending on robot version)
- This manual

3.2.1. Robot Arm

About the robot arm

The Joints, Base and Tool Flange are the main components of the robot arm. The controller coordinates joint motion to move the robot arm.

Attaching an end effector (tool) to the Tool Flange at the end of the robot arm, allows the robot to manipulate a workpiece. Some tools have a specific purpose beyond manipulating a part, for example, QC inspection, applying adhesives and welding.

The main components of the robot arm.

- **Base:** where the robot arm is mounted.
- **Shoulder and Elbow:** make larger movements.
- **Wrist 1 and Wrist 2:** make finer movements.
- **Wrist 3:** where the tool is attached to the Tool Flange.

The robot is partly completed machinery, as such a Declaration of Incorporation is provided. A risk assessment is required for each robot application.

Light Ring

Description

The light ring at the base of the robot arm provides status indication as described in the table below.

NOTICE

The light ring configuration can be modified and/or disabled by the user. See the Script Directory for further information.

NOTICE

The color spectrum of the light ring can deviate at maximum ambient temperature.

Robot base

1	Light ring
2	Base

Color codes

Color	Mode	
	Steady	Flashing slow 0.5Hz
Red	Robot not moving or in the process of stopping. 1. Emergency stop	
Yellow	Robot not moving or in the process of stopping. 1. Robot stop (previously known as Protective stop) 2. Recovery 3. Safeguard stop (all types)	
Green	Automatic mode 1. Running	Automatic mode 1. Running at reduced parameters
Blue	Manual mode Not Automatic, Not being moved 1. Booting process	Robot can be moved by hand 1. Backdrive 2. Freedrive
OFF	No power available to the robot arm 1. Fault 2. Violation 3. Loading Screen 4. System power OFF	

3.2.2. Control Box

About the Control Box

The Control Box houses the connection ports and Controller Inputs and Outputs (I/O) used in robot arm programs and installations. The connection ports are used for external connections. The I/O are groups of electrical interfaces used for communication and configuration.

External connections ports.

	Safety	Remote	Power	Configurable Inputs		Configurable Outputs		Digital Inputs		Digital Outputs		Analogue Inputs
Emergency Stop	24V	12V	PWR	24V	24V	0V	0V	24V	24V	0V	0V	AG
	E10	GND	GND	CI0	CI4	CO0	CO4	DI0	DI4	DO0	DO4	A10
	24V	ON	24V	24V	24V	0V	0V	24V	24V	0V	0V	AG
	E11	OFF	0V	CI1	CI5	CO1	CO5	DI1	DI5	DO1	DO5	A11
SafeGuard Stop	24V			24V	24V	0V	0V	24V	24V	0V	0V	AG
	S10			CI2	CI6	CO2	CO6	DI2	DI6	DO2	DO6	A00
	24V			24V	24V	0V	0V	24V	24V	0V	0V	AG
	S11			CI3	CI7	CO3	CO7	DI3	DI7	DO3	DO7	A01

Input and Output (I/O) groups.

For detailed descriptions of the Control Box connection ports and the Controller I/O, see the Installation.

3.2.3. Teach Pendant with 3-Position Enabling Device

Description

Depending on the robot generation, your Teach Pendant can include a built-in 3PE device. This is called a 3-Position Enabling Teach Pendant (3PE TP). Higher payload robots can only use the 3PE TP.

If you are using a 3PE TP, the buttons are located on the underside of the Teach Pendant, as illustrated below. You can use either button, according to your preference.

If the Teach Pendant is disconnected, you are required to connect and configure an external 3PE device. The 3PE TP functionality extends to the PolyScope interface, where there are additional functions in the Header.

NOTICE

- If you have bought a UR15, UR20 or UR30 robot, a Teach Pendant without the 3PE device will not work.
- Using a UR15, UR20, or UR30 robot requires an external enabling device or a 3PE Teach Pendant when programming, or teaching, within the reach of the robot application. See ISO 10218-2.
- The 3PE Teach Pendant is not included with the purchase of the OEM Control Box, so enabling device functionality is not provided.

Overview of TP

1. Power button
2. Emergency Stop button
3. USB port (comes with a dust cover)
4. 3PE buttons

Freedrive

A Freedrive robot symbol is located under each 3PE button, as illustrated below.

3PE Teach Pendant Button Functions

Description

NOTICE
The 3PE buttons are only active in Manual mode. In Automatic mode, robot movement does not require 3PE button action.

The table below describes the functions of the 3PE buttons.

Position		Description	Action
1	Release	There is no pressure on the 3PE button. It is not pressed.	Robot movement is stopped in Manual mode. Power is not removed from the robot arm and the brakes remain released.
2	Light-press (Grip lightly)	There is some pressure on the 3PE button. It is pressed to a middle point.	Allows your program to play when the robot is in Manual mode.
3	Tight-press (Grip tightly)	There is full pressure on the 3PE button. It is pressed all the way down.	Robot movement is stopped in Manual mode. Robot is in 3PE Stop.

Button release	Button press

3.2.4. PolyScope X Overview

Overview

PolyScope X is the graphical user interface (GUI) installed on the teach pendant that operates the robot arm via touch screen. The PolyScope X interface allows you to create, load, and execute programs.

To view Main Screen

1. Tap the 3D Viewer icon  on the main navigation. This gives you a three-dimensional view of the robot arm in X-Y-Z coordinates.
2. To maximize the 3D viewing area, collapse the right drawer using the sidebar:

- Tap once the Move icon 
- Tap twice the Program structure icon 
- Tap twice the Global Variables icon 

Screen Layout

The PolyScope X GUI is divided as shown in the following illustration:

- **Header** - in red-border box. Also called **system manager**.
Contains a folder to load, create, and edit programs and access URCaps.
- **Main Navigation** - in green-border box. Also called **navigation hub**.
Contains icon/fields to select a main screen:
 - Hamburger icon
 - Application
 - Program
 - 3D Viewer
 - Operator Screen
- **Sidebar** - in blue-border box. Also called **multitasking panel**.
Contains icon/fields to select a multitask screen:
 - Safety checksum icon
 - Move
 - Program structure
 - Global Variables
- **Footer** - in yellow-border box. Also called **robot control bar**.
Contains buttons to control robot state, speed, and program run/play.

Screen Combinations

The main screen and the multitask screen make up the operating screen combination for the robot.

The multitask screen is independent of the main screen so you can do separate tasks. For example, you can configure a program in the main screen while moving the robot arm in the multitask screen. You also can hide the multitask screen if it is not needed.

- **Main screen**
Contains fields and options to manage and monitor robot actions.
- **Multitask screen**
Contains fields and options often relating to the main screen.

Figure 1.1: Main screen and multitask screen

To show/hide the Multitask Screen

1. In the sidebar, tap any field to show the multitask screen.
The sidebar expands to the middle of the screen so the multitask screen becomes visible.
2. Tap the currently selected field in the sidebar to hide the multitask screen.

Touch Screen

Description

The **Teach Pendant touch screen** is optimized for use in industrial environments. Unlike consumer electronics, teach pendant touch screen sensitivity is, by design, more resistant to environmental factors such as:

- Water droplets and/or machine coolant droplets
- Radio wave emissions
- Other conducted noise from the operating environment

Using the Touch Screen

The touch sensitivity is designed to avoid false selections on PolyScope X and to prevent unexpected motion of the robot.

For best results, use the tip of your finger to make a selection on the screen. In this manual/handbook, this is referred to as a **tap**.

A commercially available stylus may be used to make selections on the screen, if desired.

The preceding section lists and defines the icons/tabs and buttons in the PolyScope X interface.

Icons

Header Icons	Icon	Title	Description
		Program name	Gives access to System Manager. Allows you to load, save, and add programs and URCaps files.

Main Navigation Icons	Icon	Title	Description
		More	Access information about robot version, serial number, and settings.
		Application	Configures and sets up the robot arm settings and safety, including end effectors and communication.
		Program	View and modify robot programs.
		3D	Enables control and regulation of robot movement in X, Y, Z coordinates.
		Operator	Operates the robot using prewritten programs and shows the status of the robot.

Icons Inside the Hamburger Icon

Icon	Title	Description
	System Manager	Gives access to System Manager. Allows you to load, save, and add programs and URCaps files.
	About	Displays information about robot version and serial number.
	Settings	Configures system settings, such as language, units, password, and security.
	Reload	A safe function to apply the default settings defined in the application.
	Shutdown	To restart, power on and off the robot.

Sidebar Icons

Icon	Title	Description
	Safety Checksum	Displays the active safety checksum and gives access to detailed parameters of each robot arm parts, and changes the operational mode.
	Move	Comprehensive function for robot movement, detailing the joints, TCP, flange, base.
	Program structure	Provides structural overview of the main program, modules and functions. Access to add modules.
	Global Variables	Provides access to global variable names and their values.

Footer Icons	Icon	Title	Description
			
			
			
		Initialize	Manages the robot state. When RED, press it to make the robot operational. • Black, Power off. The robot arm is in a stopped state. • Orange, Idle. The robot arm is on, but not ready for normal operation. • Orange, Locked. The robot arm is locked. • Green, Normal. The robot arm is on and ready for normal operation. • Red, Error. The robot is in a fault state, such as e-stop. • Blue, Transition. The robot is changing state, such as brake releasing.
			
			
		Play	Starts the current loaded program.
		Step	Allows a program to be run single-stepped.
		Stop	Halts the current loaded program.
		Speed Slider	Shows in real time the relative speed at which the robot arm moves, taking safety settings into account.
		High Speed Manual Mode	The High Speed Manual slider is only available in manual mode when a Three-Position Enabling Device is configured. High Speed Manual Mode allows tool speed and elbow speed to temporarily exceed the default speed limit.

**Main
Screen
Icons**

Icon	Title	Description
	Move up	To move up a command node in a program tree.
	Move down	To move down a command node in a program tree.
	Revert	To revert a recent move of a command node in a program tree.
	Undo revert	To undo revert a recent move of a command node in a program tree.
	Suppress/ Unsuppress	To suppress and unsuppress a command node in a program tree.
	Copy	To copy a command node to another program tree.
	Paste	To paste a command node to another program tree.
	Cut	To cut a command node from a program tree.
	Delete	To delete a command node in a program tree.

4. Safety

4.1. General

Description

Read the general safety information and the instructions and guidance pertaining to risk assessment and the intended use. Subsequent sections describe and define safety-related functions particularly relevant for collaborative applications.

WARNING

An application risk assessment must be performed for the safety of personnel and equipment.

Read and understand the specific engineering data relevant to mounting and installation, in order to understand the integration of UR robots before the robot is powered on for the first time.

It is essential to observe and follow all assembly instructions in the following sections of this manual.

NOTICE

Universal Robots disclaims any and all liability if the robot (arm Control Box with or without Teach Pendant) is damaged, changed or modified in any way. Universal Robots cannot be held responsible for any damages caused to the robot or any other equipment due to programming errors, unauthorized access to the UR robot and its contents, or malfunctioning of the robot.

4.2. Safety Message Types

Description

Safety messages are used to emphasize important information. Read all the messages to help ensure safety and to prevent injury to personnel and product damage.

WARNING

Indicates a hazardous situation that, if not avoided, can result in death or serious injury.

WARNING: ELECTRICITY

Indicates a hazardous electrical situation that, if not avoided, can result in death or serious injury.

WARNING: HOT SURFACE

Indicates a hazardous hot surface where injury can result from contact and non-contact proximity.

CAUTION

Indicates a hazardous situation that, if not avoided, can result in injury.

GROUND

Indicates grounding.

PROTECTIVE GROUND

Indicates protective grounding.

NOTICE

Indicates the risk of damage to equipment and/or information to be noted.

READ MANUAL

Indicates more detailed information that should be consulted in the manual.

4.3. General Warnings and Cautions

Description

The following warnings messages can be repeated, explained or detailed in subsequent sections.

WARNING

Failure to adhere to the general safety practices, listed below, can result in injury or death.

- Verify the robot arm and tool/end effector are properly and securely bolted in place.
- Verify the robot application has ample space to operate freely.
- Verify the personnel are protected during the lifetime of the robot application including transport, installation, commissioning, programming/ teaching, operation and use, dismantling and disposing.
- Verify robot safety configuration parameters are set to protect personnel, including those who can be within reach of the robot application.
- Avoid using the robot if it is damaged.
- Avoid wearing loose clothing or jewelry when working with the robot. Tie back long hair.
- Avoid placing any fingers behind the internal cover of the Control Box.
- Inform users of any hazardous situations and the protection that is provided, explain any limitations of the protection and the residual risks.
- Inform users of the location of the emergency stop button(s) and how to activate the emergency stop in case of an emergency or an abnormal situation.
- Warn people to keep outside the reach of the robot, including when the robot application is about to start-up.
- Be aware of robot orientation to understand the direction of movement when using the Teach Pendant.
- Adhere to the requirements in ISO 10218-2.

WARNING

Handling tools/end effectors with sharp edges and/or pinch points can result in injury.

- Make sure tools/end effectors have no sharp edges or pinch points.
- Protective gloves and/or protective eyeglasses could be required.

WARNING: HOT SURFACE

Prolonged contact with the heat generated by the robot arm and the Control Box, during operation, can lead to discomfort resulting in injury.

- Do not handle or touch the robot while in operation or immediately after operation.
- Check the temperature on the log screen before handling or touching the robot.
- Allow the robot to cool down by powering it off and waiting one hour.

CAUTION

Failure to perform a risk assessment prior to integration and operation can increase risk of injury.

- Perform a risk assessment and reduce risks prior to operation.
- If determined by the risk assessment, do not enter the range of the robot movement or touch the robot application during operation. Install safeguarding.
- Read the risk assessment information.

CAUTION

Using the robot with untested external machinery, or in an untested application, can increase the risk of injury to personnel.

- Test all functions and the robot program separately.
- Read the commissioning information.

NOTICE

Very strong magnetic fields can damage the robot.

- Do not expose the robot to permanent magnetic fields.

READ MANUAL

Verify all mechanical and electrical equipment is installed according to relevant specifications and warnings.

4.4. Integration and Responsibility

Description

The information in this manual does not cover designing, installing, integrating and operating a robot application, nor does it cover all peripheral equipment that can influence the safety of the robot application. The robot application must be designed and installed in accordance with the safety requirements set forth in the relevant standards and regulations of the country where the robot is installed.

The person/s integrating the UR robot are responsible for ensuring that the applicable regulations in the country concerned are observed and that any risks in the robot application are adequately reduced. This includes, but is not limited to:

- Performing a risk assessment for the complete robot system
- Interfacing other machines and additional safeguarding if required by the risk assessment
- Setting the correct safety settings in the software
- Ensuring safety measures are not modified
- Validating the robot application is designed, and installed and integrated
- Specifying instructions for use
- Marking the robot installation with relevant signs and contact information of the integrator
- Retaining all documentation; including the application risk assessment, this manual and additional relevant documentation.

4.5. Stop Categories

Description

Depending on the circumstances, the robot can initiate three types of stop categories defined according to IEC 60204-1. These categories are defined in the following table.

Stop Category	Description
0	Stop the robot by immediate removal of power.
1	Stop the robot in an orderly, controlled manner. Power is removed once the robot is stopped.
2	*Stop the robot with power available to the drives, while maintaining the trajectory. Drive power is maintained after the robot is stopped.

*Universal Robots robots' Category 2 stops are further described as SS1 or as SS2 type stops according to IEC 61800-5-2.

5. Lifting and Handling

Description

The robot arms come in different sizes and weights, so it is important to use the appropriate lifting and handling techniques for each model. Here you can find information on how to safely lift and handle the robot.

Proper lifting and handling

1. Transport the robot to the site using a forklift.
2. Open the box as illustrated.

3. Securely strap the robot arm with the lifting sling.

4. Lift the robot arm out of the box using the strap and hook.

**CAUTION**

Use a lifting equipment when lifting heavier robot arm.

5. While the robot is lifted, support it to rotate and hang as illustrated.

**Mounting
the Robot
Arm**

The robot arm can be mounted sideways, upside-down or in an angle ($\pm 45^\circ$).

Sideways mounting

Angular mounting ($\pm 45^\circ$)

Upside-down mounting

1. Mount the robot arm. Tighten the screws and apply torque as specified in the relevant user manual.

2. Remove the strap.
3. Power on the robot and reposition shoulder joint as intended.

**NOTICE**

For sideways mounting, no need to power on the robot.

4. Re-place the strap.

5.1. Robot Arm

Description	The robot arm, depending upon weight, can be carried by one or two people unless the sling is provided. If the sling is provided, equipment for lifting and transport is required.
--------------------	--

5.1.1. Round Sling Use

Description	The round sling is provided by UR with UR Series robots. According to the manufacturer, the round sling conforms to the following standards: • EN 1492-1 :2000+A1 :2008 Textile slings - Safety - Flat woven webbing slings, made of man-made fibers, for general purpose use. • EN 1492-2 :2000+A1 :2008 Textile slings - Safety - Round slings, made of man-made fibers, for general purpose use.
--------------------	---

**WARNING**

Using the round sling without an inspection can lead to injury.

- Inspect the sling before and after each use.
- Inspect the sling during use if possible.

**WARNING**

Using a damaged round sling can result in injury.

- Carefully examine the sling visually before each use.
- Do not use the sling if it is cracked, ripped, or the stitching is loose.
- Do not use the sling if there are signs of heat damage.

**CAUTION**

Incorrect storage and/or handling can cause damage to the round sling.

- Keep the sling away from acids and bases.
- Protect the sling against sharp edges and friction.
- Do not tie a knot in the sling.

**NOTICE**

There may be specific regulations for inspecting lifting equipment in your region.

- Observe local regulations regarding inspection of lifting equipment.
- Observe local regulations regarding inspection frequency of lifting equipment.

Table

Round Sling Description			
Item	Round sling 1T x 1M/2M		
Color	Violet (according to EN 1492-2)		
Material	Polyester		
WLL Factor	1.0 (1000 KG)	Straight Lift	
	0.8 (800 KG)	Choke Hitch	

5.2. Control Box and Teach Pendant

Description

The Control Box and the Teach Pendant can each be carried by one person. While in use, all cables are to be coiled and held to prevent tripping hazards.

6. Assembly and Mounting

Description	Install and power on the robot arm and Control Box to start using PolyScope.
--------------------	--

Assemble the robot	You have to assemble the robot arm, Control Box and Teach Pendant to be able to continue.
---------------------------	---

1. Unpack the robot arm and the Control Box.
2. Mount the robot arm on a sturdy, vibration-free surface.
3. Place the Control Box on its Foot.
4. Connect the robot cable to the robot arm and the Control Box.
5. Plug in the mains, or main power cable, of the Control Box.

**WARNING**

Failure to secure the robot arm to a sturdy surface can lead to injury caused by the robot falling.

- Ensure the robot arm is secured to a sturdy surface
-

6.1. Securing the Robot Arm

Description

Dimensions and hole pattern for mounting the robot.

To power down the robot arm

WARNING

Unexpected start-up and/or movement can lead to injury

- Power down the robot arm to prevent unexpected start-up during mounting and dismounting.

1. At the left side of the footer, tap the **Robot State** icon to turn off the robot arm.
The icon color changes from green to white.
2. Press the power button on the Teach Pendant to turn off the Control Box.
3. If a Shutdown dialog box displays, tap **Power Off**.

At this point, you can continue to:

- Unplug the mains cable / power cord from the wall socket.
- Allow 30 seconds for the robot to discharge any stored energy.

**To secure
the robot
arm**

1. Place the robot arm on the surface on which it is to be mounted.
The surface must be even and clean.
 2. Tighten the six 8.8 strength, M10 bolts to a torque of 45 Nm.
(Torque values have been updated SW 5.18. Earlier printed version will show different values)
 3. If accurate re-mounting of the robot is required, use the Ø8 mm. hole and Ø8x13 mm. slot with corresponding ISO 2338 Ø8 h6 positioning pins in the mounting plate.
-

6.2. Dimensioning the Stand

Description

The structure (stand) on which the robot arm is mounted is a crucial part of the robot installation. The stand must be sturdy and free of any vibrations from external sources.

Each robot joint produces a torque that moves and stops the robot arm. During normal uninterrupted operation and during stopping motion, the joint torques are transferred to the robot stand as:

- M_z : Torque around the base z axis.
- F_z : Forces along base z axis.
- M_{xy} : Tilting torque in any direction of the base xy plane.
- F_{xy} : Force in any direction in the base xy plane.

Force and moment at base flange definition.

**Dimensioning
the Stand**

The magnitude of the loads depends on robot model, program and multiple other factors. Dimensioning of the stand shall account for the loads that the robot arm generates during normal uninterrupted operation and during category 0, 1 and 2 stopping motion.

During stopping motion, the joints are allowed to exceed the maximum nominal operating torque. The load during stopping motion is independent of the stop category type. The values stated in the following tables are maximum nominal loads in worst-case movements multiplied with a safety factor of 2.5. The actual loads will not exceed these values.

Robot Model	Mz [Nm]	Fz[N]	Mxy[Nm]	Fxy [N]
UR8 Long	1310	2240	1690	1380

Maximum joint torques during category 0, 1 and 2 stops.

Robot Model	Mz [Nm]	Fz[N]	Mxy[Nm]	Fxy [N]
UR8 Long	1090	1870	1170	1100

Maximum joint torques during normal operation.

The normal operating loads can generally be reduced by lowering the acceleration limits of the joints. Actual operating loads are dependent on the application and robot program. You can use URSim to evaluate the expected loads in your specific application.

Safety margin You can incorporate added safety margins, factoring in the following design considerations:

s

- **Static stiffness:** A stand that is not sufficiently stiff will deflect during robot motion, resulting in the robot arm not hitting the intended waypoint or path. Lack of static stiffness can also result in a poor freedrive teaching experience or protective stops.
- **Dynamic stiffness:** If the frequency of the stand matches the movement frequency of the robot arm, the entire system can resonate, creating the impression that the robot arm is vibrating. Lack of dynamic stiffness can also result in protective stops. The stand should have a minimum resonance frequency of 45 Hz.
- **Fatigue:** The stand shall be dimensioned to match the expected operating lifetime and load cycles of the complete system.

WARNING

- Potential for tip-over Hazards.
- The robot arm's operational loads can cause movable platforms, such as tables or mobile robots, to tip over, resulting in possible accidents.
- Prioritize safety by implementing adequate measures to prevent the tipping of movable platforms at all times.

CAUTION

- If the robot is mounted on an external axis, the accelerations of this axis must not be too high.

You can let the robot software compensate for the acceleration of external axes by using script command:

```
set_base_acceleration()
```

- High accelerations can cause the robot to make safety stops.

6.3. Mounting Description

Description

Tool Flange	Uses four M6 thread holes for attaching a tool to the tool flange. The M6 strength class 8.8 bolts shall be tightened with 8 Nm. For accurate tool repositioning, use a pin in the Ø6 hole provided.
Control Box	The Control Box can be hung on a wall or placed on the ground.
Teach Pendant	The Teach Pendant is wall mounted or placed onto the Control Box. Verify the cable does not cause tripping hazard. You can buy extra brackets for mounting the Control Box and Teach Pendant.

**WARNING**

Mounting and operating the robot in environments exceeding the recommended IP rating can result in injury.

- Mount the robot in an environment suited to the IP rating. The robot must not be operated in environments that exceed those corresponding to the IP ratings of the robot arm (IP65), Teach Pendant (IP54) and Control Box (IP44)

**WARNING**

Unstable mounting can result in injury.

- Always make sure the robot parts are properly and securely mounted and bolted in place.

6.3.1. Control Box Mounting

**To mount a
CB to a wall**

Use the bracket, shown below, included with the robot to mount the Control Box.
Mount the bracket to a wall, then hang the Control Box on the bracket via the mounting
pegs.

6.3.2. Control Box Clearance

Description

The flow of hot air in the Control Box can result in equipment malfunction. The recommended Control Box clearance is 200 mm on each side for sufficient cool airflow.

WARNING

A wet Control Box can cause fatal injury.

- Make sure the Control Box and cables do not come into contact with liquids.
- Place the Control Box (IP44) in an environment suited for the IP rating.

6.4. Workspace and Operating Space

Description

The workspace is the range of the fully extended robot arm, horizontally and vertically. The operating space is the location where the robot is expected to function.

NOTICE

Disregard for the robot workspace and operating space can result in the damage to property.

It is important to consider the cylindrical volume directly above and directly below the robot base when choosing location to mount the robot. Moving the tool close to the cylindrical volume should be avoided because it causes the joints to move fast even when the tool is moving slowly. This can cause the robot to work inefficiently and can make it difficult to conduct a risk assessment.

NOTICE

Moving the tool close to the cylindrical volume can cause the joints to move too fast, leading to loss of functionality and damage to property.

- Do not move the tool close to the cylindrical volume, even when the tool is moving slowly.

The cylindrical volume is both directly above and directly below the robot base. The robot extends 1750 mm from the base joint.

Front

Tilted

6.4.1. Singularity Prevention

Description

A singularity is a pose that restricts the motion and the ability to position the robot. The robot arm can stop moving or have very sudden and fast movements when approaching and leaving singularity. During placement of robot in the workspace and definition of the operating space, it is important to take into consideration the singularity position detailed below.

WARNING

Make sure that robot motion near a singularity does not create hazards to anyone within the range of the robot arm, end effector, and workpiece.

- Set safety limits for the speed and acceleration of the elbow joint.

The following causes singularity in the robot arm:

- Outer workspace limit
- Inner workspace limit
- Wrist alignment

Outer workspace limit

The singularity occurs because the robot cannot reach far enough or it reaches outside of the maximum working area.

To avoid: Arrange the equipment around the robot to avoid it reaching outside of the recommended workspace.

**Inner
workspace
limit**

The singularity occurs because the movements are directly above or directly below the robot base. This causes many positions/orientations to be unreachable.

To avoid: Program the robot task in such a way that it is not necessary to work in or close to the central cylinder. You can also consider mounting the robot base on a horizontal surface to rotate the central cylinder from a vertical to horizontal orientation, potentially moving it away from the critical areas of the task.

**Wrist
alignment**

This singularity occurs because wrist joint 2 rotates on the same plane as the shoulder, elbow and wrist joint 1. This limits the range of movement of the robot arm, regardless of workspace.

To avoid: Layout the robot task in such a way that it is not necessary to align the robot wrist joints in this manner. You can also offset the direction of the tool, so that the tool can point horizontally without the problematic wrist alignment.

6.4.2. Fixed and Movable Installation

Description

Whether the robot arm is fixed (mounted to a stand, wall or floor) or in a movable installation (linear axis, push cart, or mobile robot base), it must be installed securely to ensure stability through all motions.

6.5. Robot Connections: Base Flange Cable

Description This subsection describes the connection for a robot arm configured with a Base Flange Cable connector.

Base Flange Cable connector The Base Flange Cable establishes the robot connection to the robot arm to the Control Box. The Robot Cable connects to the Base Flange Cable connector on one end, and to the Control Box connector on the other end.
You can lock each connector when robot connection is established.

CAUTION

Improper robot connection can result in loss of power to the robot arm.

- Do not use one Robot Cable to extend another Robot Cable.

NOTICE

Connecting the Base Flange Cable directly to any Control Box can result in equipment or property damage.

- Do not connect the Base Flange Cable directly to the Control Box.

6.6. Robot Connections: Robot Cable

Description This subsection describes the connection for a robot arm configured with a fixed 6 meter Robot Cable.

To connect the arm and Control box You can turn the connector to the right to make it easier to lock after the cable is plugged in.

- Establish the robot connection by connecting the robot arm to the Control Box with the Robot Cable.
- Plug and lock the cable from the robot into the connector at the bottom of the Control Box shown below.
- Twist the connector twice to ensure it is properly locked before turning on the robot arm.

CAUTION

Improper robot connection can result in loss of power to the robot arm.

- Do not disconnect the Robot Cable when the robot arm is turned on.
- Do not extend or modify the original Robot Cable.

6.7. Mains Connections

Description

The mains cable to the Control Box has a standard IEC plug at the end.

NOTICE

- IEC 61000-6-4:Chapter 1 scope: “This part of IEC 61000 for emission requirement applies to electrical and electronic equipment intended for use within the environment of existing at industrial (3.1.12) locations.”
- IEC 61000-6-4:Chapter 3.1.12 industrial location: “Locations characterized by a separate power network, supplied from a high- or medium-voltage transformer, dedicated for the supply of the installation”

Mains connections

To power the robot, the Control Box shall be connected to the mains via the supplied power cord. The IEC C13 connector on the power cord connects to the IEC C14 appliance inlet at the bottom of the Control Box.

WARNING: ELECTRICITY

Failure to correctly place the mains connection can result in injury.

- The power plug for the mains connection shall be placed outside the reach of the robot, such that power can be removed without exposing personnel to potential hazards.
- If additional safeguarding is implemented, the power plug for the mains connection shall also be placed outside the safeguarded space such that power can be removed without exposure to any potential hazards.

NOTICE

Always use a power cord with a country specific wall plug when connecting to the Control Box.

For <200 Vac countries, use power cord with 15A ampacity.

For >200 Vac countries, use power cord with 10A ampacity.

Do not use an adapter.

As a part of the electrical installation, provide the following:

- Connection to ground
- Main fuse
- Residual current device
- A lockable (in the OFF position) switch

A main switch shall be installed to power off all equipment in the robot application as an easy means for lockout. The electrical specifications are shown in the table below.

Parameter	Min	Typ	Max	Unit
Input voltage	90	-	264	VAC
External mains fuse (90-200V)		-	16	A
External mains fuse (200-264V)	8	-	16	A
Input frequency	47	-	440	Hz
Stand-by power	-	-	<1.5	W
Nominal operating power	90			W

**WARNING: ELECTRICITY**

Failure to follow any of the below can result in serious injury or death due to electrical hazards.

- Ensure the robot is grounded correctly (electrical connection to ground). Use the unused bolts associated with grounding symbols inside the Control Box to create common grounding of all equipment in the system. The grounding conductor shall have at least the current rating of the highest current in the system.
- Ensure the input power to the Control Box is protected with a Residual Current Device (RCD) and a correct fuse.
- Lockout all power for the complete robot installation during service.
- Ensure other equipment shall not supply power to the robot I/O when the robot is locked out.
- Ensure all cables are connected correctly before the Control Box is powered. Always use the original power cord.

7. First Boot

Description

The first boot is the initial sequence of actions you can take with the robot after assembly. This initial sequence requires you to:

- Power on the robot
- Insert the serial number
- Initialize the robot arm
- Power down the robot

CAUTION

Failure to verify the payload and installation before starting up the robot arm can lead to injury to personnel and/or property damage.

- Always verify the actual payload and installation are correct before starting up the robot arm.

CAUTION

Incorrect payload and installation settings prevent the robot arm and Control Box in functioning correctly.

- Always verify the payload and installation setting are correct.

NOTICE

Starting up the robot in lower temperature can result in lower performance, or stops, due to temperature-dependent oil and grease viscosity.

- Starting up the robot in low temperatures can require a warmup phase.

7.1. Powering On the Robot

To power on the robot

Powering on the robot turns on the Control Box and loads the display on the TP screen.

1. Press the power button on the Teach Pendant to power on the robot.

7.2. Inserting the Serial Number

To insert the serial number

Installing your robot for the first time requires you to enter the serial number on the robot arm. This procedure is also required when you re-install the software. For example, when you install a software update.

1. Select your Control Box.
2. Add the serial number as it is written on the robot arm.
3. Tap **OK** to end.

It can take a few minutes for the start screen to load.

Select Control Box

Standard

OEM AC

OEM DC

Enter Serial Number

123

456

789

0

7.3. Starting the Robot Arm

To start the robot

Starting the robot arm disengages the braking system, allowing you to start moving the robot arm and to start using PolyScope X.

1. In the left side of the footer, tap the power button or **Robot State** icon. The robot arm state is **Off**.
2. When the Initialize box displays, tap **Power On**. The robot arm state is **Booting**.

Initialize

Arm - OFF

Robot arm is currently off and not communicating with the controller.

Press "**Power On**" to send power to the arm in a locked state.

Active Payload
0.000 kg

✎

Application Payload | 0 kg

⏻ Power On

3. Tap **Unlock** to release the brakes.

Initialize

Arm - LOCKED

The robot arm is powered but for safety has its brakes applied.

Confirm that the below payload is accurate before unlocking.

Active Payload
0.000 kg

✎

Application Payload | 0 kg

⏻ Power Off

🔓 Unlock

Robot arm initialization is accompanied by sound and slight movements as the joint brakes are released.

4. The robot arm state is now **Active**, and you can start to use the interface.

Initialize

Arm - **ACTIVE**

Robot arm is currently active and can communicate with the control box and other equipment.

Press "**Power Off**" to stop the communication and power off the robot arm.

5. You can tap **Power Off** to turn off the robot arm.

When the robot arm state changes from **Idle** to **Normal**, sensor data is checked against the configured mounting of the robot arm.

If the mounting is verified, tap **START** to continue releasing all joint brakes, preparing the robot arm for operation.

7.4. Powering Down the Robot

To power down the robot arm

WARNING

Unexpected start-up and/or movement can lead to injury

- Power down the robot arm to prevent unexpected start-up during mounting and dismounting.

1. At the left side of the footer, tap the **Robot State** icon to turn off the robot arm. The icon color changes from green to white.
2. Press the power button on the Teach Pendant to turn off the Control Box.
3. If a Shutdown dialog box displays, tap **Power Off**.

At this point, you can continue to:

- Unplug the mains cable / power cord from the wall socket.
- Allow 30 seconds for the robot to discharge any stored energy.

7.5. Application Tab

The Application tab allows you to configure the settings which affect the overall performance of the robot and PolyScope X.

Figure 1.1: Application screen displaying application buttons.

Use the Application tab to access to the following configuration screens:

- [Mounting](#)
- [Frames](#)
- [Grids](#)
- [End Effectors](#)
- [Motion Profiles](#)
- [Application Variables](#)
- [Communication](#)
- [Safety](#)
- [Smart Skills](#)
- [Sidebar](#)
- [Operator Screen](#)
- [System Info](#)

7.5.1. Communication

Description

The Communication application allows you to monitor and set the live IO (input-output) signals from/to the robot control box.

Figure 1.2: Communication screen displaying IOs.

7.6. Freedrive

Description

Freedrive allows the robot arm to be manually pulled into desired positions. For most robot sizes, the most typical way to enable Freedrive is to press the Freedrive button on the Teach Pendant. More ways to enable and use Freedrive are described in the following sections.

In Freedrive, the robot arm joints move with little resistance because the brakes are released. Resistance increases as the robot arm in Freedrive approaches a predefined limit or plane. This makes pulling the robot into position feel heavy.

WARNING

Injury to personnel can occur due to unexpected motion.

- Verify the configured payload is the payload being used.
- Verify the correct payload is securely attached to the tool flange.

**Enabling
Freedrive**

You can enable Freedrive in the following ways:

- Use the 3PE Teach Pendant.
- Use the Freedrive on robot.
- Use I/O Actions.

**NOTICE**

Enabling Freedrive while you are moving the robot arm, can cause it to drift leading to faults.

- Do not enable Freedrive while you are pushing or touching the robot.

**3PE Teach
Pendant**

To use the 3PE TP button to freedrive the robot arm:

1. Rapidly light-press, release, light-press again and keep holding the 3PE button in this position.

Now you can pull the robot arm into a desired position, while the light-press is maintained.

**Freedrive on
robot**

To use Freedrive on robot to freedrive the robot arm on the PolyScope:

1. On the Main navigation, tap **Application** and then **Safety**.
2. Tap **Unlock** and enter the password.
3. Under Safety I/O, tap **Inputs**.
4. On the **Functions** drop-down menu, scroll down to **Freedrive Enabled Input**.
5. Tap **Apply** and **Apply and Restart** to restart the robot arm.
6. Tap **Confirm Configuration**.
7. Move the robot arm as desired.

Backdrive

During initialization of the robot arm, minor vibrations may be observed when the robot brakes are released. In some situations, such as when the robot is close to collision, these vibrations are undesirable. Use Backdrive to force specific joints to a desired position without releasing all brakes in the robot arm.

8. Installation

8.1. Electrical Warnings and Cautions

Warnings

Observe the following warnings for all the interface groups, including when you design and install an application.

WARNING

Failure to follow any of the below can result in serious injury or death, as the safety functions could be overridden.

- Never connect safety signals to a PLC that is not a safety PLC with the correct safety level. It is important to keep safety interface signals separated from the normal I/O interface signals.
- All safety-related signals shall be constructed redundantly (two independent channels).
- Keep the two independent channels separate so a single fault cannot lead to loss of the safety function.

WARNING: ELECTRICITY

Failure to follow any of the below can result in serious injury or death due to electrical hazards.

- Make sure all equipment not rated for water exposure remain dry. If water is allowed to enter the product, lockout-tagout all power and then contact your local Universal Robots service provider for assistance.
- Only use the original cables supplied with the robot only. Do not use the robot for applications where the cables are subject to flexing.
- Use caution when installing interface cables to the robot I/O. The metal plate in the bottom is intended for interface cables and connectors. Remove the plate before drilling holes. Make sure that all shavings are removed before reinstalling the plate. Remember to use correct gland sizes.

**CAUTION**

Disturbing signals with levels higher than those defined in the specific IEC standards can cause unexpected behaviors from the robot. Be aware of the following:

- The robot has been tested according to international IEC standards for **ElectroMagnetic Compatibility (EMC)**. Very high signal levels or excessive exposure can damage the robot permanently. EMC problems are found to happen usually in welding processes and are normally prompted by error messages in the log. Universal Robots cannot be held responsible for any damages caused by EMC problems.
- I/O cables going from the Control Box to other machinery and factory equipment may not be longer than 30m, unless additional tests are performed.

**GROUND**

Negative connections are referred to as Ground (GND) and are connected to the casing of the robot and the Control Box. All mentioned GND connections are only for powering and signalling. For PE (Protective Earth) use the M6-size screw connections marked with earth symbols inside the Control Box. The grounding conductor shall have at least the current rating of the highest current in the system.

**READ MANUAL**

Some I/Os inside the Control Box can be configured for either normal or safety-related I/O. Read and understand the complete Electrical Interface chapter.

8.2. Control Box Connection Ports

Description The underside of the I/O interface groups in the Control Box is equipped with external connection ports and a fuse, described below. There are capped openings at the base of the Control Box cabinet to run external connector cables to access the connection ports.

External connection ports

The ports for external connections are as follows:

- Teach Pendant port to use the Teach Pendant to control or program the robot arm.
- SD card port to insert an SD card.
- Ethernet port to allow ethernet type connections.
- Mini DisplayPort to support monitors using DisplayPort. This requires an active Mini Display to a DVI or HDMI converter. Passive converters do not work with DVI/HDMI ports.
- The Mini Blade Fuse is used when an external power supply is connected.

NOTICE

Connecting or disconnecting a Teach Pendant while the Control Box is powered on can cause equipment damage .

- Do not connect a Teach Pendant while the Control Box is on.
- Power off the Control Box before you connect a Teach Pendant.

NOTICE

Failure to plug in the active adapter before powering on the Control Box can hinder the display output.

- Plug in the active adapter before powering on the Control Box.
- In some cases the external monitor must be powered on before the Control Box.
- Use an active adapter that supports revision 1.2 as not all adapters function out-of-the-box.

8.3. Ethernet

Description

The Ethernet interface can be used for:

- MODBUS, EtherNet/IP and PROFINET.
- Remote access and control.

To connect the Ethernet cable by passing it through the hole at the base of the Control Box, and plugging it into the Ethernet port on the underside of the bracket.

Replace the cap at the base of the Control Box with an appropriate cable gland to connect the cable to the Ethernet port.

The electrical specifications are shown in the table below.

Parameter	Min	Typ	Max	Unit
Communication speed	10	-	1000	Mb/s

8.4. 3PE Teach Pendant Installation

Description The 3-Position Enabling Teach Pendant (3PE TP) is a safety-critical interface designed to enhance manual control. Integrated directly into the Teach Pendant, the 3PE buttons ensures that robot motion can only be initiated when the operator maintains a controlled grip.

8.4.1. Hardware Installation

To remove a Teach Pendant

NOTICE

Replacing the Teach Pendant can result in the system reporting a fault on start-up.

- Always select the correct configuration for the type of Teach Pendant.

To remove the standard Teach Pendant:

1. Power down the control box and disconnect the main power cable from the power source.
2. Remove and discard the two cable ties used for mounting the Teach Pendant cables.
3. Press in the clips on both sides of the Teach Pendant plug as illustrated, and pull down to disconnect from the Teach Pendant port.
4. Fully open/loosen the plastic grommet at the bottom of the control box and remove the Teach Pendant plug and cable.
5. Gently remove the Teach Pendant cable and Teach Pendant.

1 Clips

2 Plastic grommet

1	Cable ties
---	------------

To install a 3PE Teach Pendant

1. Place the Teach Pendant plug and cable in through the bottom of the control box and fully close/tighten the plastic grommet.
2. Push the Teach Pendant plug into the Teach Pendant port to connect.
3. Use two new cable ties to mount the Teach Pendant cables.
4. Connect the main power cable to the power source and power on the control box.

There is always a length of cable with the Teach Pendant that can present a tripping hazard if it is not stored properly.

- Always store the Teach Pendant and the cable properly to avoid tripping hazards.

8.4.2. Software Installation

To configure the 3PE TP software

1. On PolyScope, in the left menu, tap **Application** and select **Safety**.

2. Tap **Hardware** and the **Unlock** button.

3. Enter the password and tap **Confirm**. Teach Pendant is now enabled.
4. Tap **Apply** to restart the system. PolyScope continues to run.
5. Tap **Apply and restart** then **Confirm Configuration** to complete the 3PE Teach Pendant software installation.

8.5. Controller I/O

Description

The electrical interface inside the Control Box consists of groups Inputs and Outputs I/O that allow for communication and configurations between the robot arm and different types of equipment. The I/O groups include:

- Digital (24V)
- Configurable (24V)
- Analog
- Safety (24V)

The illustration below shows the layout of electrical interface groups inside the Control Box. Observe and maintain the purpose of the color scheme, as illustrated below.

Yellow with red text	Dedicated safety signals
Yellow with black text	Configurable for safety
Gray with black text	General purpose digital I/O
Green with black text	General purpose analog I/O

I/O groups

You can install the robot according to the electrical specifications which are the same for all three listed inputs.

- Safety I/O.
- Configurable I/O.
- General purpose I/O.

NOTICE

Configurable I/O are I/O configured as either safety-related I/O or normal I/O. These are the yellow terminals with black text.

It is possible to power the digital I/O from an internal 24V power supply or from an external power source by configuring the terminal block called **Power**. This block consists of four terminals. The upper two (PWR and GND) are 24V and ground from the internal 24V supply. The lower two terminals (24V and 0V) in the block are the 24V input to supply the I/O. The default configuration uses the internal power supply.

Power supply default

In this example the default configuration uses the internal power supply

**External power supply**

If more current is needed, you can connect an external power supply as shown below. The fuse is Mini Blade type with maximum current rating of 10 A and a minimum voltage rating of 32 V. The fuse must be UL marked. If the fuse is overloaded, it must be replaced.

In this example the configuration uses an external power supply for more current.

Power supply specification

The electrical specifications for both the internal and external power supply are shown below.

Terminals	Parameter	Min	Typ	Max	Unit
<i>Internal 24V power supply</i>					
[PWR - GND]	Voltage	23	24	25	V
[PWR - GND]	Current	0	-	2*	A
<i>External 24V input requirements</i>					
[24V - 0V]	Voltage	20	24	29	V
[24V - 0V]	Current	0	-	6	A

*3.5A for 500ms or 33% duty cycle.

**Digital I/O
specification**

The digital I/O are constructed in compliance with IEC 61131-2. The electrical specifications are shown below.

Terminals	Parameter	Min	Typ	Max	Unit
Digital Outputs					
[COx / DOx]	Current*	0	-	1	A
[COx / DOx]	Voltage drop	0	-	0.5	V
[COx / DOx]	Leakage current	0	-	0.1	mA
[COx / DOx]	Function	-	PNP	-	Type
[COx / DOx]	IEC 61131-2	-	1A	-	Type
Digital Inputs					
[EIx/SIx/CIx/DIx]	Voltage	-3	-	30	V
[EIx/SIx/CIx/DIx]	OFF region	-3	-	5	V
[EIx/SIx/CIx/DIx]	ON region	11	-	30	V
[EIx/SIx/CIx/DIx]	Current (11-30V)	2	-	15	mA
[EIx/SIx/CIx/DIx]	Function	-	PNP +	-	Type
[EIx/SIx/CIx/DIx]	IEC 61131-2	-	3	-	Type

*For resistive loads or inductive loads of maximum 1H.

8.5.1. Digital Input and Output

Tool Output

The tool output contains two digital output fields, tool output voltage and power supply current indicator and Dual Pin Power toggle.

- **Digital Output (DO)** - can be independently set to high or low
- **Tool Output Voltage** - selectable 0V, 12V and 24V. This setting is persistent over restarts of the robot controller
- **Power Supply** - current consumption indicator
- **Dual Pin Power** - used to toggle between digital outputs and source of power for the tool. Enabling Dual Pin Power disables the default tool digital outputs (DO)

After selecting a new output configuration, the changes take effect. The currently loaded installation is modified to reflect the new configuration. After verifying the tool outputs are working as intended, make sure to save the installation to prevent losing changes.

Digital Output The tool communication interface allows two digital outputs to be independently configured. In PolyScope, each pin has a drop-down menu that allows the output mode to be set. The following options are available:

- **Sinking:** This allows the pin to be configured in an NPN or Sinking configuration. When the output is off, the pin allows a current to flow to the ground. This can be used in conjunction with the PWR pin to create a full circuit.
- **Sourcing:** This allows the pin to be configured in a PNP or Sourcing configuration. When the output is on, the pin provides a positive voltage source (configurable in the IO Tab). This can be used in conjunction with the GND pin to create a full circuit.
- **Push / Pull:** This allows the pin to be configured in a Push / Pull configuration. When the output is on, the pin provides a positive voltage source (configurable in IO Tab). This can be used in conjunction with the GND pin to create a full circuit. When the output is off, the pin allows a current to flow to the ground.

After selecting a new output configuration, the changes take effect. The currently loaded installation is modified to reflect the new configuration. After verifying the tool outputs are working as intended, make sure to save the installation to prevent losing changes.

8.5.2. Using the Wired I/O Tab

Description Use the Wired I/O Tab screen to monitor and set the live I/O signals from/to the Control Box.

The screen displays the current state of the I/O, including during program execution. The program stops if anything is changed during execution. At program stop, all output signals retain their states. The screen updates at 10Hz, so a very fast signal might not display properly.

Configurable I/Os

Configurable I/Os can be reserved for special safety settings defined in the I/O Setup. Under those which are reserved will have the name of the safety function in place of the default or user defined name.

Configurable inputs that are reserved for safety settings are not toggleable and will be displayed as LED's only.

For unreserved I/Os, it has the following options:

- Start Program
- Stop Program
- Pause Program
- Freedrive

Digital I/Os DI have the following options:

- Start Program
- Stop Program
- Pause Program
- Freedrive

All DIs are preset to Low.

All DOs are set independently to either high or low.

Analog IOs

The analog I/O's can be set to either current [4-20mA] or voltage [0-10V] output. These settings are persistent over restarts of the robot controller and saved in the installation.

8.5.3. Drive Power Indicator

Description

The drive power indicator is a light that turns on when the robot arm is powered on, or when there is power to the robot cable. When the robot arm is powered off, the drive power indicator turns off.

The drive power indicator is connected via the Digital Outputs. It is not a safety feature and does not use safety I/Os.

Indicator

The drive power indicator can be a light that can work at 24VDC.

To set up the indicator

Setting up the indicator requires a light and wiring for the outputs.

1. Connect your drive power indicator to the Digital Outputs as shown in the image below.
2. Verify the drive power indicator is correctly connected.
 - You can power on the robot arm and verify the light turns on.
 - You can power off the robot arm and verify the light turns off.

To configure the indicator

1. In the Navigation menu, tap **Application**.
2. Select **Communication**.
3. In the side menu, select **Wired IO**.
4. Scroll to your desired output type and tap to select one of the following:
 - Configurable Output
 - Digital Output
 - Analog Output
5. Select **Action Preset**
You can name the selected output
6. In the dropdown select **High when drive power is on, otherwise Low**.

8.6. Safety I/O

Safety I/O This section describes dedicated safety input (Yellow terminal with red text) and configurable I/O (Yellow terminals with black text) when configured as safety I/O. Safety devices and equipment must be installed according to the safety instructions and the risk assessment in chapter Safety. All safety I/O are paired (redundant), so a single fault does not cause loss of the safety function. However, the safety I/O must be kept as two separate branches.

The permanent safety input types are:

- **Robot Emergency Stop** for emergency stop equipment only
- **Safeguard Stop** for protective devices
- **3PE Stop** for protective devices

Table The functional difference is shown below.

	Emergency Stop	Safeguard Stop	3PE Stop
Robot stops moving	Yes	Yes	Yes
Program execution	Pauses	Pauses	Pauses
Drive power	Off	On	On
Reset	Manual	Automatic or manual	Automatic or manual
Frequency of use	Infrequent	Every cycle to infrequent	Every cycle to infrequent
Requires re-initialization	Brake release only	No	No
Stop Category (IEC 60204-1)	1	2	2
Performance level of monitoring function (ISO 13849-1)	PLd	PLd	PLd

Safety caution Use the configurable I/O to set up additional safety I/O functionality, e.g. Emergency Stop Output. Use the PolyScope interface to define a set of configurable I/O for safety functions.

CAUTION

Failure to verify and test the safety functions regularly can lead to hazardous situations.

- Safety functions shall be verified before putting the robot into operation.
- Safety functions shall be tested regularly.

OSSD signals

All configured and permanent safety inputs are filtered to allow the use of OSSD safety equipment with pulse lengths under 3ms. The safety input is sampled every millisecond and the state of the input is determined by the most frequently seen input signal over the last 7 milliseconds.

OSSD Safety Signals

You can configure the Control Box to output OSSD pulses when a safety output is inactive/high. OSSD pulses detect the ability of the Control Box to make safety outputs active/low. When OSSD pulses are enabled for an output, a 1ms low pulse is generated on the safety output once every 32ms. The safety system detects when an output is connected to a supply and shuts down the robot.

The illustration below shows: the time between pulses on a channel (32ms), the pulse length (1ms) and the time from a pulse on one channel to a pulse on the other channel (18ms)

To enable OSSD for Safety Output

1. In the Header, tap **Installation** and select **Safety**.
2. Under **Safety**, select **I/O**.
3. On the I/O screen, under Output Signal, select the desired OSSD checkbox. You must assign the output signal to enable the OSSD checkboxes.

Default safety configuration

The robot is delivered with a default configuration, which enables operation without any additional safety equipment.

Safety	
Emergency Stop	24V
	EI0
	24V
	EI1
Safeguard Stop	24V
	SI0
	24V
	SI1

Connecting emergency stop buttons

Most applications require one or more extra emergency stop buttons. The illustration below shows how one or more emergency stop buttons can be connected.

Sharing the Emergency Stop with other machines

You can set up a shared emergency stop function between the robot and other machines by configuring the following I/O functions via the GUI. The Robot Emergency Stop Input cannot be used for sharing purposes. If more than two UR robots or other machines need to be connected, a safety PLC must be used to control the emergency stop signals.

- Configurable input pair: External Emergency Stop.
- Configurable output pair: System Stop.

The illustration below shows how two UR robots share their emergency stop functions. In this example the configured I/Os used are CI0-CI1 and CO0-CO1.

Safeguard stop with automatic resume

This configuration is only intended for applications where the operator cannot go through the door and close it behind him. The configurable I/O is used to setup a reset button outside the door to reactivate robot motion. The robot resumes movement automatically when the signal is re-established.

WARNING

Do not use this configuration if signal can be re-established from the inside of the safety perimeter.

In this example a door switch is a basic safeguard device where the robot is stopped when the door is opened.

In this example a safety mat is a safety device where automatic resume is appropriate. This example is also valid for a safety laser scanner.

**Safeguard
Stop with
reset button**

If the safeguard interface is used to interact with a light curtain, a reset outside the safety perimeter is required. The reset button must be a two channel type. In this example the I/O configured for reset is CI0-CI1.

8.6.1. Using I/O for Mode Selection

Description The robot can be configured to switch between operational modes without using the Teach Pendant. This means using the TP is prohibited when switching from Automatic mode to Manual mode and from Manual mode to Automatic mode.

Switching modes without the use of the Teach Pendant requires safety I/O configuration and a secondary device as a mode selector.

Mode selector The mode selector can be a key switch with a redundant electrical layout or with signals from a dedicated safety PLC.

To use the mode selector Using the mode selector, such as a key switch, prevents the TP from being used to switch between the modes.

1. Connect your mode selector to the inputs as shown in the image below.
2. Verify the mode selector is correctly connected and configured.

To configure the connected safety inputs

Configuring the safety inputs for the secondary device connection requires unlocking the safety I/O screen.

1. In the main navigation, tap **Application**.

2. Select **Safety** and tap **Unlock**.

When prompted, input your password to unlock the Safety screen.

If you have not previously defined a password, use the default password: `ursafe`.

3. Under Safety I/O select **Inputs**.

4. Select one of the input signals by tapping one of the Input dropdown options.

5. In the dropdown list, select **Operational Mode**.

6. Tap **Apply** and allow the robot restart.

7. Tap **Confirm Safety Configuration**.

You can now only use the secondary device to select and/or switch between operational modes.

Once the input is assigned to the secondary device, switching modes via the TP is disabled. If an attempt is made to use the TP to switch modes, a message appears confirming the TP cannot be used to change the operational mode.

8.6.2. Three Position Enabling Device

Description

The robot arm is equipped with an enabling device in the form of the 3PE Teach Pendant. The Control Box supports the following enabling device configurations:

- 3PE Teach Pendant
- External Three-Position Enabling device
- External Three-Position device and 3PE Teach Pendant

The illustration below shows how to connect a Three-Position Enabling device.

Note: The two input channels for the Three-Position Enabling Device input have a disagreement tolerance of 1 second.

NOTICE

The UR robot safety system does not support multiple external Three-Position Enabling Devices.

Operational Mode Switch

Using a Three-Position Enabling device requires the use of an Operational Mode switch.

The illustration below shows an Operational Mode switch.

8.6.3. Safety I/O Signals

Description

The I/O are divided between inputs and outputs and are paired up so that each function provides a Category 3 PLd capability.

Figure 1.3: PolyScope X screen displaying the Input signals.

Input Signals

The inputs are described in the tables below:

Emergency Stop Button	Performs a Stop Category 1 (IEC 60204-1) informing other machines using the System Stop output if that output is defined. A stop is initiated in anything connected to the output.
Robot Emergency Stop	Performs a Stop Category 1 (IEC 60204-1) via Control Box input, informing other machines using the System Emergency Stop Output if that output is defined.
External Emergency Stop	Performs a Stop Category 1 (IEC 60204-1) on robot only.
Reduced	All safety limits can be applied while the robot is using a Normal configuration, or a Reduced configuration. When configured, a low signal sent to the inputs causes the safety system to transition to the reduced configuration. The robot arm decelerates to satisfy the reduced parameters. The safety system guarantees the robot is within reduced limits less than 0.5s after the input is triggered. If the robot arm continues to violate any of the reduced limits, a Stop Category 0 is triggered. Trigger planes can also cause a transition to the reduced configuration. The safety system transitions to the normal configuration in the same way.

Input Signals

The inputs are described in the table below

Operational Mode	When an external mode selection is used it switches between Automatic Mode and Manual Mode . The robot is in Automatic mode when input is <i>low</i> and Manual mode when the input is <i>high</i> .
Safeguard Reset	Returns from the Safeguard Stop state, when a rising edge on the Safeguard Reset input occurs. When a Safeguard Stop occurs, this input ensures that the Safeguard Stop state continues until a reset is triggered.
Safeguard	A stop triggered by a safeguard input. Performs a Stop Category 2 (IEC 60204-1) in all modes, when triggered by a Safeguard.
Automatic Mode Safeguard Stop	Performs a Stop Category 2 (IEC 60204-1) in Automatic mode ONLY. Automatic Mode Safeguard Stop can only be selected when a Three-Position Enabling Device is configured and installed.
Automatic Mode Safeguard Reset	Returns from the Automatic Mode Safeguard Stop state when a rising edge on the Automatic Mode Safeguard Reset input occurs.
Freedrive on robot	You can configure the Freedrive input to enable and use Freedrive without pressing the Freedrive button on a standard TP, or without having to press-and-hold any of the buttons on the 3PE TP in the light-press position.
3-Position Enabling Device	In Manual Mode, an external 3-Position Enabling Device must be pressed and held in the center-on position to move the robot. If you are using a built-in 3-Position Enabling Device, the button must be pressed and held in the mid position to move the robot.

WARNING

When the default Safeguard Reset is disabled, an automatic reset happens when the safeguard no longer triggers a stop.

This can happen if a person passes through the field of the safeguard.

If a person is not detected by the safeguard and the person is exposed to hazards, automatic reset is forbidden by standards.

- Use the external reset to ensure resetting only when a person is not exposed to hazards.

WARNING

When Automatic Mode Safeguard stop is enabled, a safeguard Stop is not triggered in Manual Mode.

Output Signals

All safety outputs go low in the event of a safety system violation or fault. This means the System Stop output initiates a stop even when an E-stop is not triggered. You can use the following Safety functions output signals. All signals return to low when the state which triggered the high signal has ended:

¹ System Stop	Signal is <i>Low</i> when the safety system has been triggered into a stopped state including by the Robot Emergency Stop input or the Emergency Stop Button. To avoid deadlocks, if the Emergency Stopped state is triggered by the System Stop input, low signal will not be given.
Robot Moving	Signal is <i>Low</i> if the robot is moving, otherwise high.
Robot Not Stopping	Signal is <i>High</i> when the robot is stopped or in the process of stopping due to an emergency stop or safeguard stop. Otherwise it will be logic low.
Reduced	Signal is <i>Low</i> when reduced parameters are active or if the safety input is configured with a reduced input and the signal is currently low. Otherwise the signal is high.
Not Reduced	This is the inverse of Reduced, defined above.
Safe Home	Signal is <i>High</i> if the robot arm is stopped and is located in the configured Safe Home Position. Otherwise, the signal is <i>Low</i> . This is often used when UR robots are integrated with mobile robots.
3-Position Enabling Stopped	Signal is low when a three position stop is active, high otherwise.
Not 3-Position Enabling Stopped	Signal is low when a three position stop is inactive, high otherwise.

**NOTICE**

Any external machinery receiving its Emergency Stop state from the robot through the System Stop output must comply with ISO 13850. This is particularly necessary in setups where the Robot Emergency Stop input is connected to an external Emergency Stop device. In such cases, the System Stop output becomes high when the external Emergency Stop device is released. This implies that the emergency stop state at the external machinery will be reset with no manual action needed from the robot's operator. Hence, to comply with safety standards, the external machinery must require manual action in order to resume.

¹System Stop was previously known as "System Emergency Stop" for Universal Robots robots. PolyScope can display "System Emergency Stop".

8.7. General Purpose Digital I/O

Description

The Startup screen contains settings for automatically loading and starting a default program, and for auto-initializing the Robot arm during power up.

General purpose digital I/O

This section describes the general purpose 24V I/O (Gray terminals) and the configurable I/O (Yellow terminals with black text) when not configured as safety I/O.

The general purpose I/O can be used to drive equipment like pneumatic relays directly or for communication with other PLC systems. All Digital Outputs can be disabled automatically when program execution is stopped.

In this mode, the output is always low when a program is not running. Examples are shown in the following subsections.

These examples use regular Digital Outputs but any configurable outputs could also have been used if they are not configured to perform a safety function.

In this example a load is controlled from a Digital Outputs when connected.

In this example a simple button is connected to a Digital Input.

Communication with other machines or PLCs

You can use the digital I/O to communicate with other equipment if a common GND (0V) is established and if the machine uses PNP technology, see below.

8.7.1. Remote ON/OFF control

Description Use remote **ON/OFF** control to turn the Control Box on and off without using the Teach Pendant. It is typically used:

- When the Teach Pendant is inaccessible.
- When a PLC system must have full control.
- When several robots must be turned on or off at the same time.

Remote Control The remote **ON/OFF** control provides a auxiliary 12V supply, kept active when the Control Box is turned off. The **ON** input is intended only for short time activation and works in the same way as the **POWER** button. The **OFF** input can be held down as desired. Use a software feature to load and start programs automatically. The electrical specifications are shown below.

Terminals	Parameter	Min	Typ	Max	Unit
[12V - GND]	Voltage	10	12	13	V
[12V - GND]	Current	-	-	100	mA
[ON / OFF]	Inactive voltage	0	-	0.5	V
[ON / OFF]	Active voltage	5	-	12	V
[ON / OFF]	Input current	-	1	-	mA
[ON]	Activation time	200	-	600	ms

CAUTION

Maintaining a press and hold on the power button switches the Control Box OFF without saving.

- Do not press and hold the **ON** input or the **POWER** button without saving.
- Use the **OFF** input for remote off control to allow the Control Box to save open files and shut down correctly.

8.8. General Purpose Analog I/O

Description

The analog I/O interface is the green terminal. It is used to set or measure voltage (0-10V) or current (4-20mA) to and from other equipment.

The following directions is recommended to achieve the highest accuracy.

- Use the AG terminal closest to the I/O. The pair share a common mode filter.
- Use the same GND (0V) for equipment and Control Box. The analog I/O is not galvanically isolated from the Control Box.
- Use a shielded cable or twisted pairs. Connect the shield to the GND terminal at the terminal called **Power**.
- Use equipment that works in current mode. Current signals are less sensitive to interferences.

Electrical Specifications

In the GUI you can select input modes. The electrical specifications are shown below.

Terminals	Parameter	Min	Typ	Max	Unit
<i>Analog Input in current mode</i>					
[AIx - AG]	Current	4	-	20	mA
[AIx - AG]	Resistance	-	20	-	ohm
[AIx - AG]	Resolution	-	12	-	bit
<i>Analog Input in voltage mode</i>					
[AIx - AG]	Voltage	0	-	10	V
[AIx - AG]	Resistance	-	10	-	Kohm
[AIx - AG]	Resolution	-	12	-	bit
<i>Analog Output in current mode</i>					
[AOx - AG]	Current	4	-	20	mA
[AOx - AG]	Voltage	0	-	24	V
[AOx - AG]	Resolution	-	12	-	bit
<i>Analog Output in voltage mode</i>					
[AOx - AG]	Voltage	0	-	10	V
[AOx - AG]	Current	-20	-	20	mA
[AOx - AG]	Resistance	-	1	-	ohm
[AOx - AG]	Resolution	-	12	-	bit

Analog Output and Analog Input

This example illustrates controlling a conveyor belt with an analog speed control input.

This example illustrates connecting an analog sensor.

8.9. Remote Mode in Safety Overview

Description

When activated, Remote Mode allows external devices to connect to key services such as the Primary Interface.

Remote Mode can be toggled via a dedicated switch in the Safety Overview dialog.

1. Go to the safety overview in the main screen.
2. Click Mode Selection.
3. You can now select Automatic and then Remote.

"Local" is toggled as a default.

"Remote" is only active when the application is in Automatic mode.

Toggle Access

Secure Lockdown

While in Remote Mode, the PolyScope X interface enters a secure, read-only state. All editing and control actions are disabled, and only the Operator Screen remains accessible in view-only mode. Additionally, a Remote Mode icon is displayed above the Safety checksum to clearly indicate the system is under remote supervision.

I/O Controlled Safety

If the robot's operational mode is governed by an I/O signal, switching to Manual mode via I/O will automatically revert Remote Mode back to Local Mode.

This feature ensures a safe and structured environment for remote monitoring, while preserving local control integrity when needed.

9. End Effector Integration

Description The end effector can also be referred to as the tool and the workpiece in this manual.

NOTICE

UR provides documentation for the end effector to be integrated with the robot arm.

- Refer to the documentation specific to the end effector/tool/workpiece for mounting and connection.

9.1. Maximum Payload

Description The rated robot arm payload depends on the center of gravity (CoG) offset of the payload, as shown below. The CoG offset is defined as the distance from the center of the tool flange to the center of gravity of the attached payload.

The robot arm can accommodate a long center of gravity offset, if the payload is placed below the tool flange. For example when computing the payload mass in a pick and place application, consider both the gripper and the workpiece.

The robot's capacity to accelerate can be reduced if the payload CoG exceeds the robot's reach and payload. You can verify the reach and payload of your robot in the Technical Specifications.

**Payload
Curve**

Payload [kg]

Center of gravity offset [mm]

The relationship between the rated payload and the center of gravity offset.

**Payload
capacity
increase**

The robot arm can accommodate higher payloads and longer CoG offsets, if the payload is placed below the tool flange. You can increase the maximum payload capacity of the robot arm, under the following criteria:

- Movement with high payload is with tool oriented vertically downward, as is often the case in palletizing applications.
- The payload CoG is within the nominal horizontal reach of the robot.
- The CoG offset in the horizontal XY-plane does not exceed the expanded payload curve (long offsets in the Z-axis, exceeding the payload curve are not an issue).

Example of how to compute the horizontal center of gravity offset.

As illustrated above, the horizontal payload offset d_y should be within the payload curve.

Expanded payload is possible for any robot mounting orientation.

Increasing the maximum payload capacity can cause the robot to move at reduced speeds and lower acceleration. The higher load on the joints can limit some motions inside the working range of the robot. The robot software automatically ensures the mechanical limits of the robot are not exceeded.

NOTICE

Using the expanded payload range does not void your robot warranty for this robot.

Payload inertia

You can configure high inertia payloads, if the payload is set correctly. The controller software automatically adjusts accelerations when the following parameters are correctly configured:

- Payload mass
- Center of gravity
- Inertia

You can use the URSim to evaluate the accelerations and cycle times of the robot motions with a specific payload.

9.2. Securing Tool

Description

The tool or workpiece is mounted to the tool output flange at the tip of the robot.

Dimensions and hole pattern of the tool flange. All measurements are in millimeters.

Tool flange

The tool output flange (ISO 9409-1) is where the tool is mounted at the tip of the robot. It is recommended to use a radially slotted hole for the positioning pin to avoid over-constraining, while keeping precise position.

**CAUTION**

Very long M6 bolts can press against the bottom of the tool flange and short circuit the robot.

- Do not use bolts that extend beyond 8 mm to mount the tool.

**WARNING**

Failure to tighten bolts properly cause injury due to loss of the adapter flange and/or end effector.

- Ensure the tool is properly and securely bolted in place.
- Ensure the tool is constructed such that it cannot create a hazardous situation by dropping a part unexpectedly.

9.3. Tool I/O

Tool Connector

The tool connector illustrated below provides power and control signals for the grippers and sensors used on a specific robot tool. The tool connector has eight holes and is located next to the tool flange on Wrist 3.

The eight wires inside the connector have different functions, as listed below:

	Pin #	Signal	Description
	1	AI3 / RS485-	Analog in 3 or RS485-
	2	AI2 / RS485+	Analog in 2 or RS485+
	3	TO0/PWR	Digital Outputs 0 or 0V/12V/24V
	4	TO1/GND	Digital Outputs 1 or Ground
	5	POWER	0V/12V/24V
	6	TI0	Digital Inputs 0
	7	TI1	Digital Inputs 1
	8	GND	Ground

NOTICE

The Tool Connector must be manually tightened up to a maximum of 0.4 Nm.

Tool I/O Accessories

The tool I/O for all Universal Robots robots can require an accessory element to facilitate connection with tools. You can use the Tool Cable Adapter.

Tool Cable Adapter The Tool Cable Adapter is the electronic accessory that allows compatibility between tool I/O and tools.

1	Connects to the tool/end effector.
2	Connects to the robot.

**WARNING**

Connecting the Tool Cable Adapter to a robot that is powered on can lead to injury.

- Connect the adapter to the tool/end effector before connecting the adapter to the robot.
- Do not power on the robot if the Tool Cable Adapter is not connected to the tool/end effector.

The eight wires inside the Tool Cable Adapter have different functions, as listed below:

	Pin #	Signal	Description
	1	AI2 / RS485+	Analog in 2 or RS485+
	2	AI3 / RS485-	Analog in 3 or RS485-
	3	TI1	Digital Inputs 1
	4	TI0	Digital Inputs 0
	5	POWER	0V/12V/24V
	6	TO1/GND	Digital Outputs 1 or Ground
	7	TO0/PWR	Digital Outputs 0 or 0V/12V/24V
	8	GND	Ground

**GROUND**

The tool flange is connected to GND (Ground).

9.3.1. Tool I/O Installation Specifications

Description The electrical specifications are shown below. Access Tool I/O in the Installation Tab to set the internal power supply to 0V, 12V or 24V.

Parameter	Min	Typ	Max	Unit
Supply voltage in 24V mode	23.5	24	24.8	V
Supply voltage in 12V mode	11.5	12	12.5	V
Supply current (single pin)*	-	600	2000**	mA
Supply current (dual pin)*	-	600	2000**	mA
Supply capacitive load	-	-	8000***	uF

* It is highly recommended to use a protective diode for inductive loads.

** Peak for max 1 second, duty cycle max: 10%. Average current over 10 seconds must not exceed typical current.

*** When tool power is enabled, a 400 ms soft start time begins allowing a capacitive load of 8000 uF to be connected to the tool power supply at start-up. Hot-plugging the capacitive load is not allowed.

9.3.2. Tool Power Supply

Description Access Tool I/O in the Installation Tab

Dual Pin Power Supply

In Dual Pin Power mode, the output current can be increased as listed in Tool I/O.

1. In the Header, tap **Installation**.
2. In the list on the left, tap **General**.
3. Tap **Tool IO** and select **Dual Pin Power**.
4. Connect the wires Power (gray) to TO0 (blue) and Ground (red) to TO1 (pink).

NOTICE

Once the robot makes an Emergency Stop, the voltage is set to 0V for both Power Pins (power is off).

9.3.3. Tool Digital Inputs

Description The Startup screen contains settings for automatically loading and starting a default program, and for auto-initializing the Robot arm during power up.

Table The Digital Inputs are implemented as PNP with weak pull-down resistors. This means that a floating input always reads as low. The electrical specifications are shown below.

Parameter	Min	Type	Max	Unit
Input voltage	-0.5	-	26	V
Logical low voltage	-	-	2.0	V
Logical high voltage	5.5	-	-	V
Input resistance	-	47k	-	Ω

Using the Tool Digital Inputs

This example illustrates connecting a simple button.

9.3.4. Tool Digital Outputs

Description Digital Outputs support three different modes:

Mode	Active	Inactive
Sinking (NPN)	Low	Open
Sourcing (PNP)	High	Open
Push / Pull	High	Low

Access Tool I/O in the Installation Tab to configure the output mode of each pin. The electrical specifications are shown below:

Parameter	Min	Typ	Max	Unit
Voltage when open	-0.5	-	26	V
Voltage when sinking 1A	-	0.08	0.09	V
Current when sourcing/sinking	0	600	1000	mA
Current through GND	0	1000	3000*	mA

NOTICE

Once the robot makes an Emergency Stop, the Digital Outputs (DO0 and DO1) are deactivated (High Z).

CAUTION

The Digital Outputs in the tool are not current-limited. Overriding the specified data can cause permanent damage.

Using Tool Digital Outputs

This example illustrates turning on a load using the internal 12V or 24V power supply. The output voltage at the I/O tab must be defined. There is voltage between the POWER connection and the shield/ground, even when the load is turned off.

It is recommended to use a protective diode for inductive loads, as shown below.

9.3.5. Tool Analogue Inputs

Description Tool Analogue Input are non-differential and can be set to either voltage (0-10V) or current (4-20mA) on the I/O tab. The electrical specifications are shown below.

Parameter	Min	Type	Max	Unit
Input voltage in voltage mode	-0.5	-	26	V
Input resistance @ range 0V to 10V	-	10.7	-	k Ω
Resolution	-	12	-	bit
Input voltage in current mode	-0.5	-	5.0	V
Input current in current mode	-2.5	-	25	mA
Input resistance @ range 4mA to 20mA	-	182	188	Ω
Resolution	-	12	-	bit

Two examples of using Analog Input are shown in the following subsections.

Caution

CAUTION

Analog Inputs are not protected against over voltage in current mode. Exceeding the limit in the electrical specification can cause permanent damage to the input.

Using Tool Analog Inputs, Non-differential

This example shows an analog sensor connection with a non-differential output. The sensor output can be either current or voltage, as long as the input mode of that Analog Input is set to the same on the I/O tab.

Note: You can check that a sensor with voltage output can drive the internal resistance of the tool, or the measurement might be invalid.

Using Tool Analog Inputs, differential

This example shows an analog sensor connection with a differential output. Connecting the negative output part to GND (0V), works in the same way as a non-differential sensor.

9.4. Set Payload

9.4.1. Safely Setting the Active Payload

Verify installation

Before using PolyScope X, verify that the Robot Arm and Control Box are correctly installed.

1. On the Teach Pendant, press the emergency stop button.
2. On the screen, tap **OK** when the Robot Emergency Stop box appears.
3. On the Teach Pendant, press the power button and allow the system to start and load PolyScope X.
4. Tap the on-screen **Power** button at the bottom left of the screen.
5. Hold and twist the emergency stop button to unlock.
6. On the screen's footer, verify the **Robot State** is **Off**.
7. Step outside the reach (workspace) of the robot arm.
8. Tap the on-screen **Power** button.
9. In the Initialize box, tap **Power On**, and the robot state is changed to **Locked**.
10. In the Active Payload, verify the payload mass.
You can also verify the mounting position is correct, in the 3D view.
11. Tap the **Active Payload** field, and an **Edit** field appears in the main screen.
12. Enter your active payload and **Confirm**.

13. Tap **Unlock** for the robot arm to release its brake system.

10. Configuration

Description	This section describes how you get started using the robot. Among other things, it covers easy start-up, an overview of the PolyScope user interface and how to set up your first program. Additionally, it covers freedrive mode and basic operation.
--------------------	--

10.1. Settings

Description	The settings in PolyScope X can be accessed via the hamburger menu in the main navigation. You can access the following sections:
--------------------	--

- General
 - Password
 - Connection
 - Security
-

General Settings	In the general settings, you can change the preferred language, units of measurements, etc. You also update the software from the general settings.
-------------------------	---

Password Settings	In the password settings, you can find the default passwords, and how to change them to the preferred and secure passwords.
--------------------------	---

Connection Settings	In the connection settings, you can set network settings such as IP address, DNS server, etc. Settings related to UR Connect is also found here.
----------------------------	--

Security Settings	The security settings related to SSH, admin password permissions and enabling/disabling of various services in the software.
--------------------------	--

10.1.1. Password

Description	In the password settings in PolyScope X, you can find three different types of password. • Operational Mode • Safety • Admin It is possible to set the same password in all three instances, but it is also possible to set three different password to separate access and options.
--------------------	--

Password - Admin

Description	All options under Security are protected by an Admin password. The Admin password protected screens are locked by a transparent overlay rendering the settings unavailable. Accessing the Security allows you to configure the settings in the following: • Secure Shell • Permissions • Services The settings can only be modified by designated administrator/s. Unlocking any one of the options under Security, also unlocks the other options until you exit the Settings menu.
--------------------	--

Default Password	The default password for the admin password is: easybot
-------------------------	---

**NOTICE**

If you forget your admin password, it cannot be replaced or recovered.
You will have to reinstall the software.

To set the Admin password

Before you can use the Admin password to unlock protected screens, you have to change the default password.

1. Access the Hamburger menu and select **Settings**.
2. Under Password, tap **Admin**.
3. Change the current Admin password to a new one.
 - If this is the first time, change the default Admin password from "easybot" to a new password. The new password must be at least 8 characters long.
4. Use the new password to unlock the Settings menu and access the options under Security.

To exit the Settings menu

When one of the Security options is unlocked, the Close button in the bottom right of the Settings menu changes. The Close button is replaced by the Lock and Close button indicating security is unlocked.

1. On the Settings menu locate and tap the **Lock and Close** button.

Password - Operational Mode

Default Password

The default password for operational mode: operator

NOTICE

If you forget your password, it cannot be replaced or recovered. You will have to reinstall the software.

You must use the default password, when you change the password for the first time.

Change Operational Mode password

This is how you change the password for operational mode in the PolyScope X setting.

1. Tap the hamburger menu in the main navigation.
2. Tap Settings.
3. Tap Operational Mode in the Password section.
4. Add the default password, if it is the first time.
5. Add your preferred password, at least 8 characters.

Password - Safety

Default Password

The default password for safety: ursafe

NOTICE

If you forget your password, it cannot be replaced or recovered.
You will have to reinstall the software.

You have to use the default password, when you change the password for the first time.

Change Safety Password

This is how you change the safety password in the PolyScope X setting.

1. Tap the hamburger menu in the main navigation.
2. Tap Settings.
3. Tap Safety in the Password section.
4. Add the default password, if it is the first time.
5. Add your preferred password, at least 8 characters.

10.1.2. Secure Shell (SSH) Access

Description

You can manage remote access to the robot using Secure shell (SSH). The Secure shell security settings screen allows administrators to enable or disable SSH access to the robot.

To enable/disable SSH

1. Access the Hamburger menu and select **Settings**.
2. Under Security, tap **Secure shell**.
3. Slide the **Enable SSH Access** to the on position.

To the far right of the Enable SSH Access toggle button, the screen shows the port used for SSH communication.

SSH Authentication

Authentication can occur with a password and/or with a pre-shared, authorized key. Security keys can be added by tapping the **Add Key** button and selecting a security key file. Available keys are listed together. Use the trash icon to remove a selected key from the list.

10.1.3. Permissions

Description	Access to the Networking, URCap Management and Updating PolyScope X screens is restricted by default, to prevent unauthorized changes to the system. You can change the permission settings to allow access to these screens. An Admin password is required to access Permissions.
To access Permissions	1. Access the Hamburger menu and select Settings. 2. Navigate to Security and tap Permissions.
Additional system permissions	You can also lock a few important screens/functionalities with the Admin password. On the Permissions screen in Security section in the Settings menu, it is possible to specify which additional screens are to be protected by the Admin password and which screens are available to all users. The following screens/functionalities can optionally be locked: • Network settings • Update settings • URCaps section in the System Manager
To enable/disable system permissions	1. Access Permission as previously described. The protected screens are listed under Permissions. 2. For the desired screen, slide the On/Off toggle switch to the On position to enable it. 3. To disable the desired screen, slide the On/Off toggle switch to the Off position. The screen locks again once the toggle is in the Off position.

10.1.4. Services

Description	Services allow administrators to enable or disable remote access to the standard UR services running on the robot, such as Primary/Secondary Client interfaces, PROFINET, Ethernet/IP, ROS2, etc. Use the Service screen to restrict remote access to the robot by only allowing external access to the services on the robot which the specific robot application is actually using. All services are disabled by default to provide maximum security. The communication ports for each service are to right of the On/Off toggle button in the list of services.
--------------------	--

Enabling ROS2

When the ROS2 service is enabled on this screen, you can specify the ROS Domain ID (values 0-9). After changing the Domain ID, the system restarts to apply the change.

10.2. Safety Related Functions and Interfaces

Universal Robots robots are equipped with a range of built-in safety functions as well as safety I/O, digital and analog control signals to or from the electrical interface, to connect to other machines and additional protective devices. Each safety function and I/O is constructed according to EN ISO13849-1 with Performance Level d (PLd) using a category 3 architecture.

**WARNING**

The use of safety configuration parameters different from those determined as necessary for risk reduction, can result in hazards that are not reasonably eliminated, or risks that are not sufficiently reduced.

- Ensure tools and grippers are connected correctly to avoid hazards due to interruption of power.

**WARNING: ELECTRICITY**

Programmer and/or wiring errors can cause the voltage to change from 12V to 24V leading to fire damage to equipment.

- Verify the use of 12V and proceed with caution.

**NOTICE**

- The use and configuration of safety functions and interfaces must follow the risk assessment procedures for each robot application.
- The stopping time should be taken into account as part of the application risk assessment
- If the robot detects a fault or violation in the safety system (e.g. if one of the wires in the Emergency Stop circuit is cut or a safety limit is exceeded), then a Stop Category 0 is initiated.

**NOTICE**

The end effector is not protected by the UR safety system. The functioning of the end effector and/or connection cable is not monitored

10.2.1. Configurable Safety Functions

Universal Robots robot safety functions, as listed in the table below, are in the robot but are meant to control the robot system i.e. the robot with its attached tool/end effector. The robot safety functions are used to reduce robot system risks determined by the risk assessment. Positions and speeds are relative to the base of the robot.

Safety Function	Description
Joint Position Limit	Sets upper and lower limits for the allowed joint positions.
Joint Speed Limit	Sets an upper limit for joint speed.
Safety Planes	Defines planes, in space, that limit robot position. Safety planes limit either the tool/end effector alone or both the tool/end effector and the elbow.
Tool Orientation	Defines allowable orientation limits for the tool.
Speed Limit	Limits maximum robot speed. The speed is limited at the elbow, at the tool/end effector flange, and at the center of the user-defined tool/end effector positions.
Force Limit	Limits maximum force exerted by the robot tool/end effector and elbow in clamping situations. The force is limited at the tool/end effector, elbow flange and center of the user-defined tool/end effector positions.
Momentum Limit	Limits maximum momentum of the robot.
Power Limit	Limits mechanical work performed by the robot.
Stopping Time Limit	Limits maximum time the robot uses for stopping after a protective stop is initiated.
Stopping Distance Limit	Limits maximum distance travelled by the robot after a protective stop is initiated.

10.2.2. Safety Function

When performing the application risk assessment, it is necessary to take into account the motion of the robot after a stop has been initiated. In order to ease this process, the safety functions *Stopping Time Limit* and *Stopping Distance Limit* can be used.

These safety functions dynamically reduces the speed of the robot motion such that it can always be stopped within the limits. The joint position limits, the safety planes and the tool/end effector orientation limits take the expected stopping distance travel into account i.e. the robot motion will slow down before the limit is reached.

10.3. Safety Configuration

NOTICE

Safety Settings are password protected.

1. In the PolyScope X Main Navigation, tap the Application tab.
2. On the workcell screen tap the Safety icon.
3. Observe that the Robot Limits screen displays, but settings are inaccessible.
4. Enter the safety password and tap UNLOCK to make settings accessible. Note: Once Safety settings are unlocked, all settings are now active.
5. Tap LOCK or navigate away from the Safety menu to lock all Safety item settings again.

10.4. Setting a Safety Password

1. In your PolyScope X Main Navigation, tap the Hamburger menu and then tap Settings.
2. On the left of the screen, in the blue menu, tap Safety Password.
3. For Old Password, type the current Safety password.
4. For New Password, type a password.
5. For Repeat Password, type the same password and tap Change Password.
6. In the top right of the menu, press CLOSE to return to previous screen.

10.5. Safety Menu Settings

The safety system limits are defined in the Safety Configuration. The safety system receives values from the input fields and detects any violation if any the values are exceeded. The robot controller prevents violations by making a robot stop or by reducing the speed.

10.5.1. Robot Limits

Limits

Limit	Description
Power	Limits maximum mechanical work produced by the robot in the environment. This limit considers the payload a part of the robot and not of the environment.
Momentum	Limits maximum robot momentum.
Stopping Time	Limits maximum time it takes the robot to stop e.g. when an emergency stop is activated.
Stopping Distance	Limits maximum distance the robot tool or elbow can travel while stopping.
Tool Speed	Limits maximum robot tool speed.
Tool Force	Limits the maximum force exerted by the robot tool in clamping situations.
Elbow Speed	Limits maximum robot elbow speed.
Elbow Force	Limits maximum force that the elbow exerts on the environment.

Safety Mode

NOTICE

Restricting stopping time and distance affect overall robot speed. For example, if stopping time is set to 300 ms, the maximum robot speed is limited allowing the robot to stop within 300 ms.

NOTICE

The tool speed and force are limited at the tool flange and the center of the two user-defined tool positions

Under normal conditions, i.e. when no Robot stop is in effect, the safety system operates in a Safety Mode associated with a set of safety limits ¹:

Safety mode	Effect
Normal	This configuration is active by default.
Reduced	This configuration activates when the Tool Center Point (TCP) is positioned beyond a Trigger Reduced mode plane, or when triggered using a configurable input.

¹Robot stop was previously known as "Protective stop" for Universal Robots.

10.5.2. Safety Planes

Description

Safety planes restrict robot workspace, the tool, and the elbow.

WARNING

Defining safety planes only limits the defined Tool spheres and elbow, not the overall limit for the robot arm.

Defining safety planes does not guarantee that other parts of the robot arm will obey this type of restriction.

Figure 1.4: PolyScope X screen displaying safety planes.

Configuring a Safety Plane

You can configure safety planes with the properties listed below:

- **Name.** This is the name used to identify the safety plane.
- **Offset from base.** This is the height of the plane from the base, measured in the Y direction.
- **Tilt.** This is the tilt of the plane, measured from the power cord.
- **Rotation.** This is the rotation of the plane, measured clockwise.

You can configure each plane with the restrictions listed below:

- **Normal.** When the safety system is in Normal mode, a normal plane is active and it acts as a strict limit on the position.
- **Reduced.** When the safety system is in Reduced mode, a reduced mode plane is active and it acts as a strict limit on the position.
- **Both.** When the safety system is either in Normal or Reduced mode, a normal and reduced mode plane is active and acts as a strict limit on the position.
- **Trigger Reduced Mode.** The safety plane causes the safety system to switch to Reduced mode if the robot Tool or Elbow is positioned beyond it.

Elbow Joint Restriction The feature is enabled by default.
You can use Restrict Elbow to prevent robot elbow joint from passing through any of your defined planes.
Disable Restrict Elbow for elbow to pass through planes.

Tool Flange Restriction Restricting the tool flange prevents the tool flange and the attached tool from crossing a safety plane. When you restrict the tool flange, the unrestricted area is the area inside of the safety plane, where the tool flange can operate normally.
The tool flange cannot cross the restricted area, outside of the safety plane.
Removing the restriction allows the tool flange to go beyond the safety plane, to the restricted area, while the attached tool remains inside of the safety plane.
You can remove the tool flange restriction when working with a large tool off-set. This will allow extra distance for the tool to move.
Restricting the tool flange requires the creation of a plane feature. The plane feature is used to set up a safety plane later in the safety settings.

10.5.3. Tool Position Restriction

Description The Tool Position screen enables users a more controlled restriction of tools and/or accessories placed on the end of the robot arm by letting you define tool positions with a radius that will interact with the safety planes by either collision detection with Tool Position and plane or enter reduced mode when tool enters plane.

Details Tool Position has two key benefits:

- Supports two custom configurations to specify where to react to safety planes.
- Visualizes Tool Positions in 3D model.

NOTICE

You can define, configure, and manage up to two tool positions.

User defined tools For the user defined tools, the user can change:

- Radius to change the radius of the tool sphere. The radius is considered when using safety planes.
- X, Y, Z positions to change the position of the tool with respect to the tool flange of the robot. The position is considered for the safety functions for tool speed, tool force, stopping distance, and safety planes.

To access Tool Position

1. Navigate to **Safety** Application.
2. Tap **Tool Position** in the left panel. On the top right side of the main screen, tap **Unlock** to activate adding tools. Enter the safety password and **Confirm**.

3. In the central panel's **Tool Positions** column, tap **+ Add Tool**. The added tool, **Tool_1**, appears under the **Tool Flange** tree.
4. Tap the **kebab icon** of the added tool to rename it to something more identifiable. You can also delete it.

5. In the central panel's **Properties** column, you can find four editable fields for **radius**, **x**, **y**, and **z positions**. Tap the fields to change the radius and x, y, z coordinates as needed. The sphere in the right panel updates live in the 3D model to assist with accurate placement.
6. Tap **Apply** in the top-right part of the main screen.

7. The robot will now interact with safety planes when the tool position spheres come into contact with them.

11. Cybersecurity Threat Assessment

11.1. General Cybersecurity

Description

Connecting a Universal Robots robot to a network can introduce cybersecurity risks. These risks can be mitigated by using qualified personnel and implementing specific measures for protecting the robot's cybersecurity.

Implementing cybersecurity measures requires conducting a cybersecurity threat assessment.

The purpose is to:

- Identify threats
- Define trust zones and conduits
- Specify the requirements of each component in the application

WARNING

Failure to conduct a cybersecurity risk assessment can place the robot at risk.

- The integrator or competent, qualified personnel shall conduct a cybersecurity risk assessment.

NOTICE

Only competent, qualified personnel shall be responsible for determining the need for specific cybersecurity measures and for providing the required cybersecurity measures.

11.2. Cybersecurity Requirements

Description

Configuring your network and securing your robot requires you to implement the threat measures for cybersecurity.

Follow all the requirements before you start configure your network, then verify the robot setup is secure.

Cybersecurity

- Operating personnel must have a thorough understanding of general cybersecurity principles and advanced technologies as used in the UR robot.
- Physical security measures must be implemented to allow only authorized personnel physical access to the robot.
- There must be adequate control of all access points. For example: locks on doors, badge systems, physical access control in general.

**WARNING**

Connecting the robot to a network that is not properly secured, can introduce security and safety risks.

- Only connect your robot to a trusted and properly secured network.

**Network
configuration
requirements**

- Only trusted devices are to be connected to the local network.
- There must be no inbound connections from adjacent networks to the robot.
- Outgoing connections from the robot are to be restricted to allow the smallest relevant set of specific ports, protocols and addresses.
- Only URCaps and magic scripts from trusted partners can be used, and only after verifying their authenticity and integrity

**Robot setup
security
requirements**

- Change the default password to a new, strong password.
- Disable the "Magic Files" when not actively used (PolyScope 5).
- Disable SSH access when not needed. Prefer key-based authentication over password-based authentication
- Set the robot firewall to the most restrictive usable settings and disable all unused interfaces and services, close ports and restrict IP addresses
-

11.3. Cybersecurity Hardening Guidelines

Description

Although PolyScope includes many features for keeping the network connection secure, you can harden security by observing the following guidelines:

- Before connecting your robot to any network, always change the default password to a strong password.

NOTICE

You cannot retrieve or reset a forgotten or lost password.

- Store all passwords securely.

- Use the built-in settings to restrict the network access to the robot as much as possible.
- Some communication interfaces have no method of authenticating and encrypting communication. This is a security risk. Consider appropriate mitigating measures, based on your cybersecurity threat assessment.
- SSH tunneling (Local port forwarding) must be used to access robot interfaces from other devices if the connection crosses the trust zone boundary.
- Remove sensitive data from the robot before it is decommissioned. Pay particular attention to the URCaps and data in the program folder.
 - To ensure secure removal of highly sensitive data, securely wipe or destroy the SD card.

12. Communication Networks

Fieldbus

You can use the Fieldbus options to define and configure the family of industrial computer network protocols used for real-time distributed control accepted by PolyScope:

- MODBUS
 - Ethernet/IP
 - PROFINET
 - PROFIsafe
 - UR Connect
-

12.1. MODBUS

Description

Here, the MODBUS client (master) signals can be set up. Connections to MODBUS servers (or slaves) on specified IP addresses can be created with input/output signals (registers or digital). Each signal has a unique name so it can be used in programs.

Add Signal You may customized a signal name when adding a signal. Select the signal type, signal direction and specify frequency, timeout and other advanced settings. Signal could use single address or multiple addresses.

Add Signal [Close]

Signal Name: MODBUS [Edit] ☐ Address Range

Address

From: 0 [Edit] To: 1 [Edit]

Program action

Signal Type: Read Digital Inp... [Dropdown]

Advanced settings

Frequency: 10 Hz [Dropdown] Timeout: 2 s [Edit] Slave address: 255 [Edit]

[Close] [Add]

Signal Source

Modbus signal source settings can be edited and deleted, Tap the **Config** button to edit, and tap the trashcan icon to delete.

Program name: modbus

- Wired IO
- Tool IO
- Modbus
 - Source [Config] [Add Source]

Modbus: Source

IP address: 127.0.0.1 [Edit] ☐ Sequential mode

Reconnect count: 1 MODBUS packet errors: 0 Connection status: Connected

Read Digital Inputs

MODBUS_PLC_IN [Config] [Delete]

Write Digital Outputs

MODBUS_PLC_OUT [Config] [Delete]

[+ Add Signal]

Robot State: Off

Speed: 100 %

Programming

Similar to other input signals, Modbus signals can be monitored. In the Program, on **Wait** command, select **Signal Input** under **Wait Type**. Then choose the Modbus source, the specific input signal, and the state to wait for.

Address ranges can not be used in logical expressions. The program can use only single address, even if it is part of a range.

A Modbus output signal can be configured from **Set** command.

12.2. Ethernet/IP

Description

EtherNet/IP is a network protocol that enables the connection of the robot to an industrial EtherNet/IP scanner device. If the connection is enabled, you can select the action that occurs when a program loses EtherNet/IP scanner device connection.

Enable Ethernet/IP

This is how you enable Ethernet/IP function in PolyScope X.

1. In the top right of the screen, tap the Hamburger menu and then tap Settings.
2. In the menu on the left, under Security, tap Services.
3. Tap the Profinet button to switch Profinet on.

Using Ethernet/IP

Find the Ethernet/IP functions in PolyScope X:

In the PolyScope X left header.

1. Tap the Application icon.
2. Select the relevant action from the list.

Ignore PolyScope X ignores the loss of EtherNet/IP connection, and the program continues to run.

Pause PolyScope X pauses the current program. The program resumes from where it stopped.

Stop PolyScope X stops the current program.

In the upper right corner of this screen, you can see the Ethernet/IP status.

Connected The robot is connected to the Ethernet/IP Scanner Device.

No Scanner Ethernet/IP is running, but no device is connected to the robot via Ethernet/IP.

Disabled Ethernet/IP is not enabled.

12.3. Profinet

Description

The PROFINET network protocol enables or disables the connection of the robot to an industrial PROFINET IO-Controller. If the connection is enabled, you can select the action that occurs when a program loses PROFINET IO-Controller connection.

Enable Profinet

This is how you enable Profinet function in PolyScope X.

1. In the top right of the screen, tap the Hamburger menu and then tap Settings.
2. In the menu on the left, under Security, tap Services.
3. Tap the Profinet button to switch Profinet on.

Using Profinet

Find the profinet functions in PolyScope X:

In the PolyScope X left header.

1. Tap the Application icon.
2. Select Profinet from the left menu.

Select the relevant action from the list:

Ignore	PolyScope X ignores the loss of Profinet connection, and the program continues to run.
Pause	PolyScope X pauses the current program. The program resumes from where it stopped.
Stop	PolyScope X stops the current program.

12.4. UR Connect

Connect PolyScope X to myUR Cloud

You have to connect your PolyScope X software to the myUR Cloud service. You need to find your PIN code in your myUR account.

1. Go to Settings.
2. Go to UR Connect.
3. Hit the "Connect" button on the main UR Connect page.
4. Add your pin code from myUR.

When you see the green icon in the right corner of the window, you are connected to the myUR Cloud.

**Unsuccessful
connect**

If you see the "Incorrect PIN code", please review your PIN code from myUR.

Diagnostics

If you experience any unexpected when the UR Connect is active, you can go to the Diagnostics.

1. Go to Settings.
2. Go to UR Connect.
3. Hit the kebab menu in the top right corner.
4. Select the "Diagnostics".

Export logs It is possible to export the UR Connect logs from your PolyScope X software.

1. Go to Settings.
2. Go to UR Connect.
3. Hit the kebab menu in the top right corner.
4. Select the "Export Logs"
5. Select "Export to myUR" or "Export to USB".

13. Risk Assessment

Description

The risk assessment is a requirement that shall be performed for the application. The application risk assessment is the responsibility of the integrator. The user can also be the integrator.

The robot is partly completed machinery, as such the safety of the robot application depends on the tool/end effector, obstacles and other machines. The party performing the integration must use ISO 12100 and ISO 10218-2 to conduct the risk assessment. Technical Specification ISO/TS 15066 can provide additional guidance for collaborative applications. The risk assessment shall consider all tasks throughout the lifetime of the robot application, including but not limited to:

- Teaching the robot during set-up and development of the robot application
- Troubleshooting and maintenance
- Normal operation of the robot application

A risk assessment must be conducted **before** the robot application is powered on for the first time. The risk assessment is an iterative process. After physically installing the robot, verify the connections, then complete the integration. A part of the risk assessment is to determine the safety configuration settings, as well as the need for additional emergency stops and/or other protective measures required for the specific robot application.

Safety configuration settings

Identifying the correct safety configuration settings is a particularly important part of developing robot applications. Unauthorized access to the safety configuration must be prevented by enabling and setting password protection.

WARNING

Failure to set password protection can result in injury or death due to purposeful or inadvertent changes to configuration settings.

- Always set password protection.
- Set up a program for managing passwords, so that access is only by persons who understand the effect of changes.

Some safety functions are purposely designed for collaborative robot applications. These are configurable through the safety configuration settings. They are used to address risks identified in the application risk assessment.

The following limit the robot and as such can affect the energy transfer to a person by the robot arm, end effector and workpiece.

- **Force and power limiting:** Used to reduce clamping forces and pressures exerted by the robot in the direction of movement in case of collisions between the robot and the operator.
- **Momentum limiting:** Used to reduce high transient energy and impact forces in case of collisions between robot and operator by reducing the speed of the robot.
- **Speed limitation:** Used to ensure the speed is less than the configured limit.

The following orientation settings are used to avoid movements and reduce exposure of sharp edges and protrusions to a person.

- **Joint, elbow and tool/end effector position limiting:** Used to reduce risks associated with certain body parts: Avoid movement towards head and neck.
- **Tool/end effector orientation limiting:** Used to reduce risks associated with certain areas and features of the tool/end effector and work-piece: Avoid sharp edges being pointed towards the operator, by turning the sharp edges inward towards the robot.

Stopping performance risks

Some safety functions are purposely designed for any robot application. These features are configurable through the safety configuration settings. They are used to address risks associated with the stopping performance of the robot application.

The following limit the robot stopping time and stopping distance to ensure stopping will occur before reaching the configured limits. Both settings automatically affect the speed of the robot to ensure the limit is not exceeded.

- **Stopping Time Limit:** Used to limit the stopping time of the robot.
- **Stopping Distance Limit:** Used to limit the stopping distance of the robot.

If either of the above is used, there is no need for manually performed periodic stopping performance testing. The robot safety control does continuous monitoring.

If the robot is installed in a robot application where hazards cannot be reasonably eliminated or risks cannot be sufficiently reduced by use of the built-in safety-related functions (e.g. when using a hazardous tool/end effector, or hazardous process), then safeguarding is required.

**WARNING**

Failure to conduct an application risk assessment can increase risks.

- Always conduct an application risk assessment for foreseeable risks and reasonably foreseeable misuse.

For collaborative applications, the risk assessment includes the foreseeable risks due to collisions and to reasonably foreseeable misuse.

The risk assessment shall address:

- Severity of harm
- Likelihood of occurrence
- Possibility to avoid the hazardous situation

Potential hazards

Universal Robots identifies the potential significant hazards listed below for consideration by the integrator. Other significant hazards can be associated with a specific robot application.

- Penetration of skin by sharp edges and sharp points on tool/end effector or tool/end effector connector.
- Penetration of skin by sharp edges and sharp points on nearby obstacles.
- Bruising due to contact.
- Sprain or bone fracture due to impact.
- Consequences due to loose bolts that hold the robot arm or tool/end effector.
- Items falling out of, or flying from the tool/end effector, e.g. due to a poor grip or power interruption.
- Mistaken understanding of what is controlled by multiple emergency stop buttons.
- Incorrect setting of the safety configuration parameters.
- Incorrect settings due to unauthorized changes to the safety configuration parameters.

13.1. Pinch Hazard

Description

You can avoid pinching hazards by removing obstacles in these areas, by placing the robot differently, or by using a combination of safety planes and joint limits to eliminate the hazards by preventing the robot moving into this area of its workspace.

CAUTION

Placing the robot in certain areas can create pinching hazards that can lead to injury.

Due to the physical properties of the robot arm, certain workspace areas require attention regarding pinching hazards. One area (left) is defined for radial motions when the wrist 1 joint is at least 1750 mm from the base of the robot. The other area (right) is within 400 mm of the base of the robot, when moving tangentially.

13.2. Stopping Time and Stopping Distance

Description

The graphical data provided for **Joint 0 (base)**, **Joint 1 (shoulder)** and **Joint 2 (elbow)** is valid for stopping distance and stopping time:

- Category 0
- Category 1
- Category 2

The **Joint 0** test was carried out using a horizontal movement, where the rotational axis was perpendicular to the ground. During the **Joint 1** and **Joint 2** tests, the robot followed a vertical trajectory, where the rotational axes were parallel to the ground, and the stop was done while the robot was moving downward.

The Y-axis is the distance from where the stop is initiated to the final position.

NOTICE

You can set user-defined safety rated maximum stopping times and distances. If user-defined settings are used, the program speed is dynamically adjusted to always comply with the selected limits.

NOTICE

Some of the plots below may not reach 100% speed for high extensions and payloads. This occurs because the robot's inbuilt safety compliance functions dynamically reduce the robot speed to ensure safe operation in these high-load cases.

**Joint 0
(BASE)**

Stopping
distance in
meters for
33% of 8 kg.

Stopping
distance in
meters for
66% of 8 kg.

Stopping distance in meters for maximum payload of 8 kg

Joint 0 (BASE)

Stopping time in seconds for 33% of 8 kg.

Stopping time
in seconds for
66% of 8 kg.

Stopping time
in seconds for
maximum
payload of
8 kg.

**Joint 1
(SHOULDER)**

Stopping distance in meters for 33% of 8 kg.

Stopping distance in meters for 66% of 8 kg

Stopping distance in meters for maximum payload of 8 kg

Joint 1 (SHOULDER)

Stopping time in seconds for 33% of 8 kg

Stopping time
in seconds for
66% of 8 kg

Stopping time

Stopping time in seconds for 33% of 8 kg

Stopping time
in seconds for
66% of 8 kg

Stopping time
in seconds for
maximum
payload of
8 kg

14. Emergency Events

14.1. Emergency Stop

Description

The Emergency Stop or E-stop is the red push-button located on the Teach Pendant. Press the emergency stop push-button to stop all robot motion. Activating the emergency stop push-button causes a stop category one (IEC 60204-1). Emergency stops are not safeguards (ISO 12100).

Emergency stops are complementary protective measures that do not prevent injury. The risk assessment of the robot application determines if additional emergency stop push-buttons are required. The emergency stop function and the actuating device must comply with ISO 13850.

After an emergency stop is actuated, the push-button latches in that setting. As such, each time an emergency stop is activated, it must be manually reset at the push-button that initiated the stop.

Before resetting the emergency stop push-button, you must visually identify and assess the reason the E-stop was first activated. Visual assessment of all the equipment in the application is required. Once the problem is solved, reset the emergency stop push-button.

To reset the emergency stop push-button

1. Hold the push-button and twist clockwise until the latching disengages.
You should feel when the latching is disengaged, indicating the push-button is reset.
2. Verify the situation and whether to reset the emergency stop.
3. After resetting the emergency stop, restore power to the robot and resume operation.

14.2. Movement Without Drive Power

Description

In the event of an emergency, when powering the robot is either impossible or unwanted, you can use forced back-driving to move the robot arm.

Forced back-driving requires you to push, or pull, the robot arm hard to move the joint. Bigger robot arms can involve more than one person to move the joint.

Each joint brake has a friction clutch that enables movement during high forced torque. Forced back-driving requires high force and one or more people may be required to move the robot.

In clamping situations, two or more people are required to do the forced back-driving. In some situations, two or more people are required to disassemble the robot arm.

Personnel using the UR robot are to be trained to respond to emergency events. Supplemental information shall be provided, on integration.

WARNING

Risks due to an unsupported robot arm breaking or falling can cause injury or death.

- Do not disassemble the robot during an emergency event.
- Support the robot arm before removing power.

NOTICE

Moving the robot arm manually is intended for emergency and service purposes only. Unnecessary moving of the robot arm can lead to property damage.

- Do not move the joint more than 160 degrees, to ensure the robot can find its original physical position.
- Do not move any joint more than necessary.

14.3. Clamp Connection: Disassembly

Description

WARNING

Unsupported joints can fall, or be dropped, resulting in injury.

- Support joints while clamps are being removed.

NOTICE

Failure to support the joint/s while clamps are removed can result in damage to equipment.

- Prevent the joint/s from falling while removing the clamp/s by doing any of the following:
 - Use something to support underneath the part that is coming off.
 - Disassemble the joint while it is laying down.
 - Support with lifting equipment.

Failure to test the old joint before replacing it, can lead to damage to property and/or equipment.

Always perform a joint verification test before replacing a joint. See the Joint Verification section in the Service Manual for more information.

**To
Disassembl
e**

1. Attach the ESD wristband from the spare part package or tool kit to an electrical grounded surface.
2. Remove the black flat-ring.
You can use a pair of pointy tweezers or a small flathead screwdriver.

3. Remove the screws and the clamp on one side.

4. Support the joint as you remove the second side of the clamp.

5. The joint is now loose and can be removed.

6. Gently unplug the connector from the PCB on joint.

7. The joint has now been dismantled.

14.4. Operational Mode

Description You access and activate different modes using Teach Pendant or the Dashboard Server. If an external mode selector is integrated, it control the modes - not PolyScope or the Dashboard Server.

Automatic Mode When this mode is activated the robot can only execute a program of pre-defined tasks. You cannot modify or save programs and installations.

Manual Mode When this mode is activated you can program the robot. You can modify and save programs and installations. The speeds used in Manual Mode must be limited to prevent injury. When the robot is operating in Manual Mode, a person could be positioned within reach of the robot. The speed must be limited to the value that is appropriate for the application risk assessment.

WARNING

Injury can occur if the speed used, while the robot is operating in Manual Mode, is too high.

Recovery Mode This mode activates when a safety limit from the active limit set is violated, the robot arm performs a Stop Category 0. If an active safety limit, such as a joint position limit or a safety boundary, is violated already when the robot arm is powered on, it starts up in Recovery mode. This makes it possible to move the robot arm back within the safety limits. In Recovery mode, the movement of the robot arm is restricted by a fixed limit that you cannot customize.

High Speed Manual Mode When this mode is enabled, you can temporarily exceed the default speed limit of the tool and the elbow.

The robot performs a Safeguard Stop in Manual mode, if a Three-Position Enabling Device is configured, and either released (not pressed) or it is fully compressed.

Switching between Automatic mode to Manual mode requires the Three-Position Enabling Device to be fully released and pressed again to allow the robot to move. When using High Speed Manual Mode, use safety joint limits or safety planes to restrict the robot's moving space.

NOTICE

After five minutes of inactivity the speed limit resets to the default.

To enable High Speed Manual

1. Tap **Application** and select **Safety**.
2. Access the **Three Position** options.
3. On the page, slide the button **Allow manual high speed**.

Mode switching

Operational mode	Manual	Automatic
Move robot with +/- on Move Tab	x	
Freedrive	x	
Execute Programs	Reduced speed*	x
Edit & save program	x	

*If a Three-Position Enabling device is configured, the robot operates at Manual Reduced Speed unless High Speed Manual Mode is enabled.

**WARNING**

- Any suspended safeguards must be returned to full functionality before selecting Automatic Mode.
- Wherever possible, Manual Mode shall only be used with all persons located outside the safeguarded space.
- If an external mode selector is used, it must be placed outside the safeguarded space.
- No-one is to enter, or be within, the safeguarded space in Automatic Mode, unless safeguarding is used or the collaborative application is validated for power and force limiting (PFL).

Three-Position Enabling Device

When a Three-Position Enabling Device is used and the robot is in Manual Mode, movement requires pressing the Three-Position Enabling Device to the center-on position. The Three-Position Enabling Device has no effect in Automatic Mode.

**NOTICE**

- Some UR robot sizes might not be equipped with a Three-Position Enabling Device. If the risk assessment requires the enabling device, a 3PE Teach Pendant must be used.

A 3PE Teach Pendant (3PE TP) is recommended for programming. If another person can be within the safeguarded space when in Manual Mode, an additional device can be integrated and configured for the additional person's use.

Switching Modes

To switch between modes, in the Right Header, select the profile icon to display the Mode Selection.

- Automatic indicates the operational mode of the robot is set to Automatic.
- Manual indicates the operational mode of the robot is set to Manual.

PolyScope X is automatically in Manual Mode when the Safety I/O configuration with Three-Position Enabling Device is enabled.

Select Remote Mode

It is only possible to change the remote mode, when you have changed the operational mode to "Automatic".
If you change remote mode from "remote" to "local" the operational mode will go back to "manual".

15. Transportation

Description Only transport the robot in its original packaging. Save the packaging material in a dry place if you want to move the robot later.
When moving the robot from its packaging to the installation space, hold both tubes of the robot arm at the same time. Hold the robot in place until all mounting bolts are securely tightened at the base of the robot.
Lift the Control Box by its handle.

WARNING

Incorrect lifting techniques, or using improper lifting equipment, can lead to injury.

- Avoid overloading your back or other body parts when lifting the equipment.
- Use proper lifting equipment.
- All regional and national lifting guidelines shall be followed.
- Make sure to mount the robot according to the instructions in Mechanical Interface.

NOTICE

If the robot is attached to 3rd third-party application/ installation during transport, please refer to the following:

- Transporting the robot without its original packaging will void all warranties provided by Universal Robots A/S.
- If the robot is transported as part of a prefabricated solution, securely mounted, and in full compliance with the recommendations outlined below, it is not considered a breach of warranty.

Disclaimer Universal Robots cannot be held responsible for any damage caused by transportation of the equipment.
See the recommendations for transportation without packaging at: universal-robots.com/manuals

15.1. Transportation Without Packaging

Description Universal Robots always recommends transporting the robot in its original packaging. These recommendations are written to reduce unwanted vibrations in joints and brake systems and reduce joint rotation. If the robot is transported without its original packaging, then please refer to the following guidelines:

- Fold the robot as much as possible - do not transport the robot in the singularity position.
- Move the center of gravity in the robot as close to the base as possible.
- Secure each tube to a solid surface on two different points on the tube.
- Secure any attached end effector rigidly in 3 axes.

Transport

Fold the robot as much as possible.

Do not transport extended. (singularity position)

Secure the tubes to a solid surface. Secure attached end effector in 3 axes.

15.2. Teach Pendant Storage

Description	The operator needs to have a clear understanding about what the e-Stop on the Teach Pendant affects when pressed. For example there can be confusion with a multi-robot installation. It should be made clear if the e-Stop on the Teach Pendant stops the whole installation or only its connected robot. If there could be confusion, store the Teach Pendant such that the e-Stop button is not visible or usable.
--------------------	---

15.3. Long Term Storage

Description	This section describes general guidelines for long-term storage of robots and spare parts. This applies for all robot generations and spare parts. A robot is considered long-term stored when it is stored for a period of 6 months or more.
--------------------	---

Guidelines	In order to keep the robot and spare parts in its best possible condition, it is recommended to follow normal good practice which is: • Storage temperature: 10°C - 30°C • Humidity: RH 20-60% • Universal Robots recommends to unpack and start up robots at least yearly and let them run a light load program rotating in all joints at least 90 degrees 5 times in each direction to distribute the lubricants. If possible, also mount spare parts joints on an arm and perform the same operation routine. • In rare occurrences there may be a need for wiping down the robots after storage to remove any excess lubricants that have migrated out of the sealings. • The battery is designed to last for the lifetime of the robot and will not be charged when power is applied to the system. The battery service life is 8 to 10 years, but for e-Series and UR Series it can be replaced. • Flash memory can lose their data capacity over time, therefore there is a potential risk that the data on e.g. the SD-card will have to re-flashed.
-------------------	--

16. Maintenance and Repair

Description

Any maintenance work, inspection and calibration shall be conducted in compliance with all safety instructions in this manual, the UR Service Manual, and according to local requirements.

Repair work shall be done by Universal Robots. Client designated, trained individuals can do repair work, provided they follow the Service Manual.

Safety for Maintenance

The purpose of maintenance and repair is to ensure the system is kept functioning as expected.

When working on the robot arm or control box, you must observe the procedures and warnings below.

WARNING

Failure to adhere to any of the safety practices, listed below, can result in injury.

- Unplug the main power cable from the bottom of the Control Box to ensure that it is completely unpowered. Power off any other source of energy connected to the robot arm or Control Box. Take necessary precautions to prevent other persons from powering on the system during the repair period.
- Check the earth connection before re-powering the system.
- Observe ESD regulations when parts of the robot arm or Control Box are disassembled.
- Prevent water and dust from entering the robot arm or Control Box.

**Safety for
Maintenance****WARNING**

Failure to leave space to accommodate the Control Box with the door fully open can lead to injury.

- Provide at least 915 mm of space to enable the Control Box door to open fully, providing access for servicing.

**WARNING: ELECTRICITY**

Disassembling the Control Box power supply too quickly after switching off, can result in injury due to electrical hazards.

- Avoid disassembling the power supply inside the Control Box, as high voltages (up to 600 V) can be present inside these power supplies for several hours after the Control Box has been switched off.

After troubleshooting, maintenance, and repair work, ensure that safety requirements are fulfilled. Adhere to national or regional work safety regulations. The correct functioning of all safety function settings shall also be tested and validated.

**Lockout
Tagout**

UR robots can be de-energized and locked in the de-energized state. This is to control hazardous energy due to tasks associated with installation, maintenance or repair of the robot, robot application or robot cell.

To perform "Lockout" or "control of hazardous energy" of the power to the robot, you can use a power plug lock to prevent the power cord from being reattached to the Control Box, for example Brady 148081 Plug Lockout for IEC.

**WARNING: ELECTRICITY**

Exposure to hazardous energy or the release of contained hazardous energy can result in electrical shock and serious injury.

- Use a power plug lockout to prevent the power cord from being reattached to the control box. For example see Brady 148081 Plug Lockout for IEC plug or equivalent.

After troubleshooting, maintenance, and repair work, ensure that safety requirements are fulfilled. Adhere to national or regional work safety regulations. The correct functioning of all safety function settings shall also be tested and validated.

16.1. Testing Stopping Performance

Description	Test periodically to determine if stopping performance is degraded. Increased stopping times can require safeguarding to be modified, possibly with changes to the installation. If stop time and/or stop distance safety functions are used and are the basis of the risk reduction strategy, no monitoring or testing of stopping performance is required. The robot does continuous monitoring.
--------------------	--

16.2. Robot Arm Cleaning and Inspection

Description	As part of regular maintenance the robot arm can be cleaned, in accordance with the recommendations in this manual and local requirements.
--------------------	--

Cleaning Methods	To address the dust, dirt, or oil on the robot arm and/or Teach Pendant, simply use a cloth alongside one of the cleaning agents provided below.
-------------------------	--

Surface Preparation: Before applying the below solutions, surfaces may need to be prepared by removing any loose dirt or debris.

Cleaning agents:

- Water
- 70% Isopropyl alcohol
- 10% Ethanol alcohol
- 10% Naphtha (Use to remove grease.)

Application: The solution is typically applied to the surface that needs cleaning using a spray bottle, brush, sponge, or cloth. It can be applied directly or diluted further depending on the level of contamination and the type of surface being cleaned.

Agitation: For stubborn stains or heavily soiled areas, the solution may be agitated using a brush, scrubber, or other mechanical means to help loosen the contaminants.

Dwell Time: If necessary, the solution is allowed to dwell on the surface for a up to 5 minutes to penetrate and dissolve the contaminants effectively.

Rinsing: After the dwell time, the surface is typically rinsed thoroughly with water to remove the dissolved contaminants and any remaining cleaning agent residue. It's essential to ensure thorough rinsing to prevent any residue from causing damage or posing a safety hazard.

Drying: Finally, the cleaned surface may be left to air dry or dried using towels.

WARNING

DO NOT USE BLEACH in any diluted cleaning solution.

**WARNING**

Grease is an irritant and can cause an allergic reaction. Contact, inhalation or ingestion can cause illness or injury. To prevent illness or injury, adhere to the following:

- **PREPARATION:**
 - Ensure that the area is well ventilated.
 - Have no food or beverages around the robot and cleaning agents.
 - Ensure that an eye wash station is nearby.
 - Gather the required PPE (gloves, eye protection)
- **WEAR :**
 - Protective gloves: Oil resistant gloves (Nitrile) impermeable and resistant to product.
 - Eye protection is recommended to prevent accidental contact of grease with eyes.
- **DO NOT INGEST.**
- **In the event of**
 - contact with skin, wash with water and a mild cleaning agent
 - a skin reaction, get medical attention
 - contact with the eyes, use an eyewash station, get medical attention.
 - inhalation of vapors or ingestion of grease, get medical attention
- **After grease work**
 - clean contaminated work surfaces.
 - dispose responsibly of any used rags or paper used for cleaning.
- **Contact with children and animals is prohibited.**

**Robot Arm
Inspection
Plan**

The table below is a checklist of the type of inspections recommended by Universal Robots. Perform inspections regularly as advised in the table. Any referenced parts found to be in an unacceptable state must be rectified or replaced.

Inspection action type			Timeframe		
			Monthly	Biannually	Annually
1	Check flat rings	V		X	
2	Check robot cable	V		X	
3	Check robot cable connection	V		X	
4	Check Robot Arm mounting bolts *	F	X		
5	Check Tool mounting bolts *	F	X		
6	Round Sling	F			X

**Robot Arm
Inspection
Plan****NOTICE**

Using compressed air to clean the robot arm can damage the robot arm components.

- Never use compressed air to clean the robot arm.

**Robot Arm
Inspection
Plan**

1. Move the Robot Arm to ZERO position, if possible.
2. Turn off and disconnect the power cable from Control Box.
3. Inspect the cable between Control Box and Robot Arm for any damage.
4. Check the base mounting bolts are properly tightened.
5. Check the tool flange bolts are properly tightened.
6. Inspect the flat rings for wear and damage.
 - Replace the flat rings if they are worn out or damaged.

**NOTICE**

If any damage is observed on a robot within the warranty period, contact the distributor where the robot was purchased.

Inspection

1. Unmount any tool/s or attachment/s or set the TCP/Payload/CoG according to tool specifications.
2. To move the robot arm in Freedrive:
 - On a 3PE Teach Pendant, rapidly light-press, release, light-press again and keep holding the 3PE button in this position.

Power button

3PE button

3. Pull/Push the robot to a horizontally elongated position and release.

4. Verify the robot arm can maintain the position without support and without activating Freedrive.

16.3. Software Installation

To configure the 3PE TP software

1. On PolyScope, in the left menu, tap **Application** and select **Safety**.

2. Tap **Hardware** and the **Unlock** button.

3. Enter the password and tap **Confirm**. Teach Pendant is now enabled.
4. Tap **Apply** to restart the system. PolyScope continues to run.
5. Tap **Apply and restart** then **Confirm Configuration** to complete the 3PE Teach Pendant software installation.

17. Disposal and Environment

Description Universal Robots robots must be disposed of in accordance with the applicable national laws, regulations and standards. this responsibility rests with the owner of the robot.

UR robots are produced in compliance with restricted use of hazardous substances to protect the environment; as defined by the European RoHS directive 2011/65/EU. If robots (robot arm, Control Box, Teach Pendant) are returned to Universal Robots Denmark, then the disposal is arranged by Universal Robots A/S.

The disposal fee for UR robots sold on the Danish market is prepaid to DPA-system by Universal Robots A/S. Importers in countries covered by the European WEEE Directive 2012/19/EU must make their own registration to the national WEEE register of their country. The fee is typically less than 1€/robot.

You can find a list of national registers here: <https://www.ewrn.org/national-registers>.
Search for Global Compliance here: <https://www.universal-robots.com/download>.

Substances in the UR robot**Robot arm**

- Tubes, Base Flange, Tool mounting bracket: Anodized aluminum
- Joint housings: Powder coated aluminum
- Black band sealing rings: AEM rubber
 - additional slip ring under black band: moulded black plastic
- Endcaps/ lids: PC/ASA Plastic
- Minor mechanical components e.g. screws, nuts, spacers (steel, brass, and plastic)
- Wire bundles with copper wires and minor mechanical components e.g. screws, nuts, spacers (steel, brass, and plastic)

Robot arm joints (internal)

- Gears: Steel and grease (detailed in the Service Manual)
- Motors: Iron core with copper wires
- Wire bundles with copper wires, PCB's, various electronic components and minor mechanical components
- Joint seals and O-rings contain a small amount of PFAS which is a compound within PTFE (commonly known as Teflon™).
- Grease: synthetic + mineral oil with a thickener of either lithium complex soap or Urea. Contains molybdenum.
 - Depending on model and date of production, the color of the grease could be yellow, magenta, dark pink, red, green.
 - The Service Manual details the handling precautions and Grease Safety Data Sheets

Control box

- Cabinet (enclosure): Powder coated steel
 - Standard Control Box
- Aluminum sheet metal housing (internal to the cabinet). This is also the housing of the OEM controller.
 - Standard Control Box and OEM controller.
- Wire bundles with copper wires, PCB's, various electronic components, plastic connectors, and minor mechanical components e.g. screws, nuts, spacers (steel, brass, and plastic)
- A lithium battery is mounted to a PCB. See the Service Manual for how to remove.

18. Declarations and Certifications

18.1. Declaration of Incorporation (original)

UNIVERSAL ROBOTS

EU Declaration of Incorporation (DOI) (in accordance with 2006/42/EC Annex II B)

original: EN

Manufacturer: Universal Robots A/S Energivej 51, DK-5260 Odense S DK	Person in the Community Authorized to Compile the Technical File: David Brandt, Technology Officer, Compliance Universal Robots A/S, Energivej 25, DK-5260 Odense S Denmark	
Description and Identification of the Partly-Completed Machine(s):		
Product and Function:	Industrial robot multi-purpose multi-axis manipulator with standard control box, standard length cables & with or without UR 3PE teach pendant. Function is determined by the completed machine (robot application or cell with end-effector, intended use and application program).	
Model: Serial Number:	UR8Long, UR15, UR18, UR20, UR30 with a standard control box: NOTE: This DOI is NOT applicable when the OEM Controller is used. See control box markings. Starting 2024 6 8 00252 and higher for the UR20* year ———— Sequential numbering, restarting at 0 each year series ———— 6 = UR8Long, 7 = UR15, 5 = UR18, 8 = UR20, 9 = UR30 *TÜV Rheinland certifications: UR20: 11 Mar '24 (#00252). UR30: 14 Mar '24. UR15: May '25. UR8Long (#00019) & UR18 (#00012): 31 Jul '25	
Incorporation:	Universal Robots UR8Long, UR15, UR18, UR20 & UR30 shall only be put into service upon being integrated into a final complete machine (robot application or robot cell), which conforms with the provisions of the Machinery Directive and other applicable Directives.	
It is declared that the above products fulfil, for what is supplied, the following directives as detailed below: When this partly completed machine is integrated and becomes a complete machine, the integrator is responsible for the completed machine fulfilling all applicable Directives, applying the CE mark and providing the Declaration of Conformity (DOC).		
I. Machinery Directive 2006/42/EC	The following essential requirements have been fulfilled: 1.1.2, 1.1.3, 1.1.5, 1.1.6, 1.2.1, 1.2.4.3, 1.2.5, 1.2.6, 1.3.1, 1.3.2, 1.3.4, 1.3.8.1, 1.3.9, 1.4.1 with 3PE TP, 1.5.1, 1.5.2, 1.5.4, 1.5.5, 1.5.6, 1.5.8, 1.5.10, 1.6.3, 1.7.1.1, 1.7.2, 1.7.4, 1.7.4.1, 1.7.4.2, 4.1.2.1, 4.1.2.3, 4.1.2.5 (sling), 4.1.3, 4.3.3, Annex VI. It is declared that the relevant technical documentation has been compiled in accordance with Part B of Annex VII of the Machinery Directive.	
II. Low-voltage Directive 2014/35/EU	Reference the LVD and the harmonized standards used below.	
III. EMC Directive 2014/30/EU	Reference the EMC Directive and the harmonized standards used below.	
Reference to the harmonized standards used, as referred to in Article 7(2) of the MD & LV Directives and Article 6 of the EMC Directive:		
(I) EN ISO 10218-1:2011 ✖ (I) EN ISO 12100:2010 (I) EN ISO 13849-1:2015 ✖ 2023 edition has no relevant changes (I) EN ISO 13849-2:2012 ✖ See TÜV Rheinland Certificates	(I) EN ISO 13732-1:2008 (I) EN ISO 13850:2015 (I) EN IEC 60204-1:2018 as applicable (I, II) EN 60947-5-5:1997+A1:2005 +A11:2013+A2:2017	(I) EN IEC 60947-5-8:2014 & 2021 (III) EN IEC 61000-3-2:2014 & 2019 (III) EN 61000-3-3:2013 (III) EN 61000-6-2: 2012 & 2019 (II) EN 61140:2002/A1:2006 & 2016
Reference to other technical standards and technical specifications used:		
(I) ISO 9409-1:2004 (I) ISO/TS 15066:2016 as applicable (III) EN 60068-2-1:2007 (III) EN 60068-2-2:2007	(III) EN 60068-2-27:2009 (III) EN 60068-2-64:2008+A1:2019 (II) EN IEC 60320-1:2021 (II) EN 60529:1991/AC:2016	(II) EN 60664-1:2007 (III) EN IEC 61000-6-4:2023 (II) EN IEC 61784-3:2021 [SIL 2] (III) EN 61326-3-1:2017 [Industrial locations SIL 2]
The manufacturer, or his authorised representative, shall transmit relevant information about the partly completed machinery in response to a reasoned request by the national authorities.		
Approval of full quality assurance system by the notified body Bureau Veritas: ISO 9001 certificate #DK019348, ISO 14001 certificate DK019349, and ISO 45001 certificate #DK019350.		

Odense Denmark, 25 August 2025

18.2. Certifications UR8 Long

Description

Third party certification is voluntary. However, to provide the best service to robot integrators, Universal Robots chooses to certify its robots at the recognized test institutes listed below.

You can find copies of all certificates in the chapter: Certificates.

Certification

	TÜV Rheinland	Certificates by TÜV Rheinland to EN ISO 10218-1 and EN ISO 13849-1. TÜV Rheinland stands for safety and quality in virtually all areas of business and life. Founded 150 years ago, the company is one of the world's leading testing service providers.
 TÜV Rheinland®	TÜV Rheinland of North America	In Canada, the Canadian Electrical Code, CSA 22.1, Article 2-024 requires equipment to be certified by a testing organization approved by the Standards Council of Canada.
	CHINA RoHS	Universal Robots e-Series robots conform to CHINA RoHS management methods for controlling pollution by electronic information products.
	KCC Safety	Universal Robots e-Series robots have been assessed and conform to KCC mark safety standards.
	KC Registration	The Universal Robots e-Series robots have been evaluated for conformity assessment for use in a work environment. Therefore, there is a risk of radio interference when used in a domestic environment.
	Delta	Universal Robots e-Series robots are performance tested by DELTA.

Supplier Third Party Certification

	Environment	As provided by our suppliers, Universal Robots e-Series robots shipping pallets comply with the ISMPM-15 Danish requirements for producing wood packaging material and are marked in accordance with this scheme.
---	-------------	---

**Manufacturer
Test
Certification**

	Universal Robots	Universal Robots e-Series robots undergo continuous internal testing and end of line test procedures. UR testing processes undergo continuous review and improvement.
---	---------------------	--

**Declarations
according to
EU directives**

Although EU directives are relevant for Europe, some countries outside Europe recognize and/or require EU declarations. European directives are available on the official homepage: <http://eur-lex.europa.eu>.

According to the Machinery Directive, Universal Robots' robots are partly completed machines, as such a CE mark is not to be affixed.

You can find the Declaration of Incorporation (DOI) according to the Machinery Directive in the chapter: Declarations and Certificates.

See additional page(s) for the listing of 3 factories

Report Number: 31875333 027

Client Reference: Roberta Nelson Shea

Certification acc. to: EN ISO 10218-1:2011
EN ISO 13849-1:2015

Product Information

Certified Product: Industrial Robot

Model Designation: UR3, UR5, UR10, UR15, UR20, UR30, UR3e, UR5e,
UR7e, UR10e, UR12e, UR16e, UR8 Long, UR18

Technical Data: Rated Voltage: AC 100-200V, 50/60Hz or AC 200-240V, 50/60Hz
Rated Current: 15A or 8A
Protection Class: I

Special Remarks: The robot is only a component in a final robot application, collaborative or non-collaborative. The final application/installation must comply with EN ISO 10218-2. Certificate is only valid within used in conjunction with the UR Control Box, with or without a UR Teach Pendant. Includes optional IMMI accessory. The following safety functions have been evaluated and determined to meet Pld Cat. 3 per EN ISO 13849-1:2015:

1- Emergency Stop;	2- Safeguard Stop
3- Joint Position Limit;	4- Joint Speed Limit
5- Pose Limit;	6- Cartesian Speed Limit
7- Force Limit;	8- Momentum Limit
9- Power Limit;	10- Stopping Time Limit
11- Stopping Distance Limit;	12- System Emergency Stop Output
13- Robot Moving Digital Output;	
14- Robot Not Stopping Digital Output	
15- Reduced Mode Digital Output;	
16- Not Reduced Mode Digital Output	
17- 3 Position Enabling Device INPUT	

Refer to product manual for additional information.
Must be installed and programmed in accordance with the manufacturer's instructions.

Remarks: Replaces Certificate T72501672.

19. Safety Functions Table

Description

Universal Robots safety functions and safety I/O are PLd Category 3 (ISO 13849-1), where each safety function has a PFH value less than 1.8E-07.

The PFH values are updated to include greater design flexibility for supply chain resilience.

For safety I/O the resulting safety function including the external device, or equipment, is determined by the overall architecture and the sum of all PFHs, including the UR robot safety function PFH.

If any safety function limit is exceeded or a fault is detected in a safety function or safety-related part of the control system, UR defines the safe state as a stop with removal of drive power (either a stop category 1 or 03 immediate removal of power).

NOTICE

The Safety Functions tables presented in this chapter are simplified. You can find the comprehensive versions of them here: <https://www.universal-robots.com/support>

SF1 1, 2, 3, 4 Emergency Stop (ISO 13850)

See footnotes

Description	What happens?	Affects
Pressing the Estop PB on the pendant ¹ or the External Estop (if using the Estop Safety Input) results in a Stop Cat 1 ⁴ with power removed from the robot actuators and the tool I/O. Controller I/O go "low". Command ¹ all joints to stop and upon all joints coming to a monitored standstill state, power is removed. See Stop Time & Stop Distance Safety Functions ⁵ . ONLY USE FOR EMERGENCY PURPOSES, not to be used for safeguarding.	Stop Category 1 (IEC 60204-1)	Robot, robot tool I/O, and controller IO

SF2 3, 4 Safeguard Stop 4 (Protective Stop according to ISO 10218-1*)

* Prior to 2006, this was called "safety stop" or "safeguard stop"

Description	What happens?	Affects
This safety function is initiated by an external protective device using safety inputs which will initiate a Stop Cat 2 ⁴ . The purpose is to protect people from injury, as compared to protecting the robot, equipment, or products. The tool I/O are <u>unaffected</u> by the safeguard stop. If an enabling device is connected, it is possible to configure the safeguard stop to function in automatic mode ONLY . See the Stop Time and Stop Distance Safety Functions ⁵ .	Stop Category 2 (IEC 60204-1) SS2 stop (as described in IEC 61800-5-2)	Robot

**SF3
Joint
Position
Limit
(soft axis
limiting)**

Description	What happens?	Tolerance	Affects
Sets upper and lower limits for the allowed joint positions. Stopping time and distance is not considered as the limit(s) will not be violated. Each joint can have its own limits. <i>Directly limits the set of allowed joint positions that the joints can move within. It is a means of safety-rated soft axis limiting & space limiting, according to ISO 10218-1:2011, 5.12.3.</i>	Will not allow motion to exceed any limit settings. Speed could be reduced so motion will not exceed any limit. A robot stop will be initiated to prevent exceeding any limit.	5°	Joint (each)

**SF4
Joint
Speed
Limit**

Description	What happens?	Tolerance	Affects
Sets an upper limit for the joint speed. Each joint can have its own limit. This safety function has the most influence on energy transfer upon contact (clamping or transient). <i>Directly limits the set of allowed joint speeds which the joints are allowed to perform. It is set in the safety setup part of the User Interface. Used to limit fast joint movements, e.g. risks related to singularities.</i>	Will not allow motion to exceed any limit settings. Speed could be reduced so motion will not exceed any limit. A robot stop will be initiated to prevent exceeding any limit.	1.15 °/s	Joint (each)

**Joint Torque
Limit**

Description
Exceeding the internal joint torque limit (each joint) results in a Cat 03 Stop. This safety function is not accessible to the user; it is a factory setting. It is NOT shown as a safety function because there are no user settings.

**SF5
Called
various
names:
Pose Limit,
Tool Limit,
Orientation
Limit, Safety
Planes,
Safety
Boundaries**

Description	What happens?	Tolerance	Affects
Monitors the TCP Pose (position and orientation) and will prevent exceeding a safety plane or TCP Pose Limit. Multiple pose limits are possible (tool flange, elbow, and up to 2 configurable tool offset points with a radius) Orientation restricted by the deviation from the feature Z direction of the tool flange OR the TCP. This safety function has two parts. One is the safety planes for limiting the possible TCP positions. The second is the TCP orientation limit, which is entered as an allowed direction and a tolerance. This provides TCP and wrist inclusion/ exclusion zones due to the safety planes.	Will not allow motion to exceed any limit settings. Speed or torques could be reduced so motion will not exceed any limit set for SF 5, SF 6, SF 7 or SF 8. A robot stop will be initiated to prevent exceeding any limit. Will not allow motion to exceed any limit settings	3° 40 mm	TCP Tool flange Elbow

**SF6
Speed
Limit
TCP &
Elbow**

Description	What happens?	Tolerance	Affects
Monitors the TCP and elbow speed to prevent exceeding a speed limit. Equivalent to monitoring the whole arm as the sections between the TCP and elbow cannot move faster than the endpoints of these sections.	Will not allow motion to exceed any limit settings. Speed or torques could be reduced so motion will not exceed any limit set for SF 5, SF 6, SF 7 or SF 8. A robot stop will be initiated to prevent exceeding any limit. Will not allow motion to exceed any limit settings.	50 mm/s	TCP

**SF7
Force
Limit
(TCP &
Elbow)**

Description	What happens?	Tolerance	Affects
The Force Limit is the force exerted by the robot at the TCP (tool center point) and "elbow". The safety function continuously calculates the torques allowed for each joint to stay within the defined force limit for both the TCP & the elbow. The joints control their torque output to stay within the allowed torque range. This means that the forces at the TCP or elbow will stay within the defined force limit. When a stop is initiated by the Force Limit SF, the robot will stop. The UR standard controller will cause motion to "back-off" to the position before the force limit was exceeded. This "back-off" is not part of the safety function as it is done by the standard controller. The safety controller has a fixed time (part of the response time) allowed before a robot stop is initiated (regardless of "back-off").	Will not allow motion to exceed any limit settings. Speed or torques could be reduced so motion will not exceed any limit set for SF 5, SF 6, SF 7 or SF 8. A robot stop will be initiated to prevent exceeding any limit. Will not allow motion to exceed any limit settings.	25N	TCP

**SF8
Momentum
Limit**

Description	What happens?	Tolerance	Affects
The momentum limit is very useful for limiting transient impacts. The Momentum Limit affects the entire robot.	Will not allow motion to exceed any limit settings. Speed or torques could be reduced so motion will not exceed any limit set for SF 5, SF 6, SF 7 or SF 8. A robot stop will be initiated to prevent exceeding any limit. Will not allow motion to exceed any limit settings.	3kg m/s	Robot

**SF9
Power
Limit**

Description	What happens?	Tolerance	Affects
This function monitors the mechanical work (sum of joint torques times joint angular speeds) performed by the robot, which also affects the current to the robot arm as well as the robot speed. This safety function dynamically limits the current/ torque but maintains the speed.	Dynamic limiting of the current/ torque	10W	Robot

**New SF15
Stopping
Time Limit**

Description	What happens?	Tolerance	Affects
Real time monitoring of conditions such that the stopping time limit will not be exceeded. Robot speed is limited to ensure that the stop time limit is not exceeded. The stopping capability of the robot in the given motion(s) is continuously monitored to prevent motions that would exceed the stopping limit. If the time needed to stop the robot is at risk of exceeding the time limit, the speed of motion is reduced to ensure the limit is not exceeded. A stop will be initiated to prevent exceeding the limit.	Will not allow the actual stopping time to exceed the limit setting. Causes decrease in speed or a robot stop so as NOT to exceed the limit.	50 ms	Robot

**New SF16
Stopping
Distance
Limit**

Description	What happens?	Tolerance	Affects
Real time monitoring of conditions such that the stopping distance limit will not be exceeded. Robot speed is limited to ensure that the stop distance limit will not be exceeded. The stopping capability of the robot in the given motion(s) is continuously monitored to prevent motions that would exceed the stopping limit. If the time needed to stop the robot is at risk of exceeding the time limit, the speed of motion is reduced to ensure the limit is not exceeded. A stop will be initiated to prevent exceeding the limit.	Will not allow the actual stopping time to exceed the limit setting. Causes decrease in speed or a robot stop so as NOT to exceed the limit.	40 mm	Robot

**New SF17
Safe Home
Position
"monitored
position"**

Description	What happens?	Tolerance	Affects
Safety function which monitors a safety rated output, such that it ensures that the output can only be activated when the robot is in the configured and monitored "safe home position". A stop cat 0 is initiated if the output is activated when the robot is not in the configured position.	The "safe home output" can only be activated when the robot is in the configured "safe home position"	1.7°	External connection to logic &/or equipment

**SF10 UR
Robot
<Estop>
Output**

Description	What Happens	Affects
When configured for a Robot <Estop> output and there is a robot stop, the dual outputs are LOW. If there is no Robot <Estop> Stop initiated, dual outputs are high. Pulses are not used but they are tolerated. For an integrated safety function, see below These dual outputs change state for any external Estop that is connected to configurable safety inputs where this input is configured as an Emergency Stop input. <i>For the Estop Output, validation is performed at the external equipment, as the UR output is an input to this external Estop safety function for external equipment.</i> NOTE: With the IMMI (Injection Moulding Machine Interface), the Estop output is NOT connected to the IMMI (no Estop output signal from the UR robot to the IMMI) to prevent an unrecoverable stop.	Dual outputs go low in event of an Estop if configurable outputs are set	External connection to logic and/or equipment

**SF11 UR
Robot
Moving:
Digital
Output**

Description	What Happens	Affects
Whenever the robot is moving (motion underway), the dual digital outputs are LOW. Outputs are HIGH when no movement. <i>Functional safety is for what is within the UR robot. The integrated functional safety performance requires adding this PFH to the PFH of any external logic & its components.</i>	If configurable outputs are set: When the robot is moving (motion underway), dual digital outputs are LOW. When not moving, HIGH	External connection to logic &/or equipment

**SF12 UR
Robot Not
stopping
OUTPUT:
Digital Output**

Description	Affects
Whenever the robot is STOPPING (in process of stopping or in a stand-still condition) the dual digital outputs are HIGH. When outputs are LOW, robot is NOT in the process of stopping and NOT in a stand-still condition. <i>Functional safety is for what is within the UR robot. For the integrated safety function, see ⁶.</i>	External connection to logic and/or equipment

**SF13 UR
Robot
Reduced
"Mode":
Digital
Output**

Description	Affects
Whenever the robot is in reduced mode (or reduced mode is initiated), the dual digital outputs are LOW. <i>See below.</i> <i>The functional safety is for what is within the UR robot. For the integrated safety function, see ⁶.</i>	External connection to logic and/or equipment.

**SF14 UR
Robot Not
Reduced
"Mode"
OUTPUT:
Digital Output**

Description	Affects
Whenever the robot is NOT in reduced mode (or the reduced mode is not initiated), the dual digital outputs are LOW. <i>The functional safety rating is for what is within the UR robot. For the integrated safety function, see ⁶.</i>	External connection to logic and/or equipment.

**Table 1**
footnotes

¹Communications between the Teach Pendant, controller & within the robot (between joints) are SIL 2 for safety data, per IEC 61784-3.

²Estop validation: the pendant Estop pushbutton is evaluated within the pendant, then communicated¹ to the safety controller by SIL2 communications. To validate the pendant Estop functionality, press the Pendant Estop pushbutton and verify that an Estop results. This validates that the Estop is connected within the pendant, the estop functions as intended, and the pendant is connected to the controller

³If a robot safety function is “integrated” or “connected” with external equipment, devices or logic, the resulting integrated safety function has a PFH that is the sum of all PFH values, including the PFH value of the robot safety function.

⁴Stop Categories according to IEC 60204-1 (NFPA79). For the Estop, only stop category 0 and 1 are allowed according to IEC 60204-1.

- Stop Category 0 & 1 result in the removal of drive power, with stop cat 0 being IMMEDIATE & stop cat 1 being a controlled stop (e.g. decelerate to a stop then removal of drive power).
- Stop Category 2 is a stop where drive power is NOT removed. Stop category 2 is defined in IEC 60204-1. Descriptions of STO, SS1 & SS2 are in IEC 61800-5-2. With UR robots, a stop category 2 maintains the trajectory, then retains power to the drives after stopping.

⁵Stop Time & Stop Distance Safety Functions should be used. When used, there is no need for periodic verification of stopping performance.

⁶For the integrated functional safety rating with an external safety-related control system, add the PFH of this safety-related output to the PFH of the external safety-related control system.

19.1. Table 1a

**Reduced
"Mode" SF
parameter
settings
change**

Description	Affects
Reduced mode is not a mode. Can be initiated by a safety plane/ boundary (starts when at 2cm of the plane and reduced settings are achieved within 2cm of the plane) or by use of an input to initiate (will achieve reduced settings within 500ms). When the external connections are Low, Reduced Mode is initiated. Reduced Mode: all reduced mode limits are ACTIVE. <i>Reduced mode is not a safety function. It is a state change affecting the settings of the following safety function: joint position, joint speed, TCP pose, TCP speed, TCP force, momentum, power, stopping time, & stopping distance.</i> <i>Reduced mode is a means of parameterization of safety functions.</i> <i>Verified and validate all parameter settings for the robot application.</i>	Robot

**Safeguard
Reset**

Description	Affects
When configured for Safeguard Reset and the external connections transition from low to high, the safeguard stop RESETS. Safety input to initiate a reset of safeguard stop safety function.	Robot

**3-Position
Enabling
Device
INPUT**

Description	What happens	Affects
When the external Enabling Device connections are Low, a Safeguard Stop (SF2) is initiated. <i>Recommendation: Use with a mode switch as a safety input.</i> <i>If a mode switch is not used and connected to the safety inputs, then the robot mode will be determined by the User Interface. If the User Interface is in</i> <i>"run mode", the enabling device will not be active.</i> <i>"programming mode", the enabling device will be active. Password protection for changing the mode can be configured.</i>	Input to SF2	Robot

**Mode
switch
INPUT**

Description	What happens	Affects
When the external connections are Low, Automatic Mode (running) is active. When High, mode is programming/ teach. <i>Recommendation: Use with an enabling device, i.e. UR Teach Pendant with an integrated 3-position enabling device.</i> <i>When in teach/program, initially the TCP speed is limited to 250mm/s. Speed can manually be increased using the TP "speed-slider", but upon activation of the enabling device, the speed limitation will reset to 250mm/s.</i>	Input to SF2	Robot

19.2. Table 2

Description

UR robots comply with ISO 10218-1:2011 and the applicable portions of ISO/TS 15066. It is important to understand that most of ISO/TS 15066 is directed towards the integrator and not the robot manufacturer. ISO 10218-1:2011, clause 5.10] details 4 collaborative] techniques as explained below. It is important to note this is the APPLICATION when in AUTOMATIC mode.

Collaborative Operation* 2011 edition, clause 5.10.2

*ISO 10218:2025 removed the term "collaborative operation"

Technique	Explanation	UR e-Series and UR series Robots
Safety-rated monitored stop	Stop condition where position is held at a standstill and is monitored as a safety function. Category 2 stop is permitted to auto reset. In the case of resetting and restarting operation after a safety -rated monitored stop, see ISO 10218-2 and ISO/TS 15066 as resumption shall not cause hazardous conditions. NOTE: ISO 10218-2:2025 changed this term to be a Stop Category 2 followed by a monitored-standstill safety function.	UR robots' safeguard stop is a safety-rated monitored stop. <i>In ISO 10218-1:2025, the term "safety-rated monitored stop" was eliminated. There are only 3 "capabilities for collaborative application: hand-guided controls (HGC), speed and separation monitoring (SSM) and power and force limiting (PFL).</i>

Collaborative Operation 2011 edition, clause 5.10.3

*ISO 10218:2025 removed the term "collaborative operation"

Technique	Explanation	UR e-Series
Hand-guiding	This is essentially individual and direct personal control while the robot is in automatic mode. Hand guiding equipment shall be located close to the end-effector and shall have: - an Emergency Stop pushbutton; and - a 3-position enabling device; and - a safety-rated monitored stop function; and - a settable safety-rated monitored speed function. <i>See ISO 10218-2:2025, 5.14, for requirements including use of hold-to-run or 3-position enabling.</i>	UR robots do not provide hand-guiding for collaborative operation. Hand-guided teach (free drive) is provided with UR robots but this is for programming in manual mode and not for collaborative operation in automatic mode.

Collaborative Operation*
2011 edition,
clause 5.10.4

*ISO 10218:2025

removed the term

“collaborative operation”

Technique	Explanation	UR e-Series
Speed and separation monitoring (SSM) safety functions	SSM is the robot maintaining a separation distance from any operator (human). This is done by monitoring of the distance between the robot system and intrusions to ensure that the MINIMUM PROTECTIVE DISTANCE is assured. Usually, this is accomplished using Sensitive Protective Equipment (SPE), where typically a safety laser scanner detects intrusion(s) towards the robot system. This SPE causes 1. Dynamic changing of the parameters for the limiting safety functions; or 2. a safety-rated monitored stop condition. Upon detection of the intrusion exiting the protective device's detection zone, the robot is permitted to a. resume the “higher” normal safety function limits in the case of 1 above; b. resume operation in the case of 2 above. In the case of 2b restarting operation after a safety -rated monitored stop, see ISO 10218-2:2011 and ISO/TS 15066 or ISO 10218-2:2025, 5.14, Annex M, and Annex N.	To facilitate SSM, UR robots have the capability of switching between two sets of parameters for safety functions with configurable limits (normal and reduced). See Reduced Mode. Normal operation can be when no intrusion is detected. It can also be caused by safety planes/ safety boundaries. Multiple safety zones can be readily used with UR robots. For example, one safety zone can be used for “reduced settings” and another zone boundary is used as a safeguard stop input to the UR robot. Reduced limits can also include a reduced setting for the stop time and stop distance limits - to reduce the work area and floorspace.

Collaborative Operation*
2011 edition,
clause 5.10.5

*ISO 10218:2025

removed the term

“collaborative operation”

Technique	Explanation	UR e-Series
Power and force limiting (PFL)	How to accomplish PFL is left to the robot manufacturer. The robot design and/or safety functions will limit the energy transfer from the robot to a person. If a parameter limit is exceeded, a stop happens. PFL applications require considering the ROBOT APPLICATION (including the end-effector and workpiece(s), so that any contact will not cause injury. The study performed evaluated pressures to the ONSET of pain, not injury. See Annex A. See ISO/TR 20218-1 End-effectors OR ISO 10218-2:2025, 5.9.	UR robots are power and force limiting robots specifically designed to enable collaborative applications and to be used for any industrial robot application. UR robots have safety functions that can be used to limit motion, speed, momentum, force, power and more of the robot. These safety functions are used in the robot application to lessen pressures and forces caused by the end-effector and workpiece(s) upon impact.

Software Name: PolyScope X
